Planet Venus 2nd Edition:

Nonequilibrium Processes in the Planetary and Cometary Atmospheres: Theory and Applications Mikhail Ya. Marov, V. Shematovich, D. Bisikalo, Jean-Claude Gérard, 2001-11-30 This book reviews the approach to the kinetic simulation of nonequilibrium processes in the planetary atmospheres which the authors developed and dealt with since the 1970s The results of this study which are focused on the nonequilibrium collisional processes in the atmospheres of planets and comets are thoroughly reviewed and discussed Many specific problems of atmospheric modeling involving numerical evaluation of aeronomic processes are addressed and compared with the available experimental data The kinetic approach proved to be especially effective to model the interaction of the incident shortwave solar radiation with the rarefied gas of planetary upper atmospheres It involves various processes of photolysis energetic electron impacts and accompanying numerous chemical reactions as well as processes occurring in the intermediate transition zones of planetary and cometary gas envelopes The underlying mathematical treatment is based on the stochastic approach for the solution of the Boltzmann type equation and implies the development of the efficient algorithms for its computer simulation Some results of this study were previously summarized in the monograph issued in Russian Marov et al 1990 and later in the review paper published in Space Science Reviews Marov et al 1996 The basic principles of stochastic simulation were first developed in the field of rarefied gas dynamics and were successfully applied to the solution of some engineering problems of aerodynamics and heat transfer

Introduction To Earth Sciences: A Physics Approach (Second Edition) Luc Thomas Ikelle, 2020-04-04 For more than seven decades geophysicists have made significant contributions to the description of solid Earth and deep space based on the physical properties on the exploration and production of the resources deep in the ground and on an understanding and mitigation of the hazards associated with the Earth's dynamics such as volcanic eruptions earthquakes tsunamis landslides hurricanes droughts etc These types of events are so important that they directly affect where we live on the Earth's surface as well as the sources of food energy resources and minerals and such events can affect our very survival Yet most universities still do not have a course focusing on an introduction to geophysics the so called 100 level geophysics course All of the twelve chapters from the first edition have been improved and or expanded In addition to these improvements six new chapters have been added in this second edition The new chapters encompass gravity microgravity earthquake cycle heat variations in the subsurface Earth's magnetic field electricity storage energy prices and a more detailed description of our current understanding of Solar system and the applications of this understanding to life on Earth This new edition can also be used in 100 level physics classes The basic physics of matter is covered in detail along with some highly important problems and questions posed and addressed by modern physics and in Geophysics which is actually a branch of physics
