Performance of Update Algorithms for Replicated Data in a Distributed Database Hector Garcia-Molina,1979 In this thesis we study the performance of update algorithms for replicated data in a distributed database In doing so we also investigate several other related issues We start by presenting a simple model of a distributed database which is suitable for studying updates and concurrency control We also develop a performance model and a set of parameters which represent the most important performance features of a distributed database The distributed database models are used to study the performance of update algorithms for replicated data This is done in two steps First the algorithms are analyzed in the case of completely replicated databases in a no failure update only environment Then the restrictions that we made are eliminated one at a time and the impact on the system performance of doing this is evaluated For the first step we develop a new technique for analyzing the performance of update algorithms This iterative technique is based on queueing theory Several well known update algorithms are analyzed using this technique The performance results are verified through detailed

simulations of the algorithms The results show that centralized control algorithms nearly always perform better than the more popular distributed control algorithms
