Modeling Nature With Cellular Automata Using Mathematica:

Modeling Nature Richard J. Gaylord, Kazume Nishidate, 1996-08-27 A guide to using Mathematica so as to explore cellular automata within natural phenomena such as insect colonies bird flight paths and even DNA sequencing Designed for physicists life scientists and engineers in fact everyone dealing with fractals the book first introduces Mathematica before going on to provide the valuable information needed to properly motivate the code and run the simulations presented in the book All these simulations have been tested both inside and outside the classroom setting allowing the book's use as reference material as well as a textbook or course supplement Packaged together with a DOS diskette enabling cross platform access to the code The files will also be accessible via the World Wide Web

for students An accompanying Web site contains solutions and a tutorial for the implementation of the computational modeling techniques Calculations can be done in modern computing languages such as Maple Mathematica and MATLAB

Bio-Inspired Artificial Intelligence Dario Floreano, Claudio Mattiussi, 2023-04-04 A comprehensive introduction to new approaches in artificial intelligence and robotics that are inspired by self organizing biological processes and structures New approaches to artificial intelligence spring from the idea that intelligence emerges as much from cells bodies and societies as it does from evolution development and learning Traditionally artificial intelligence has been concerned with reproducing the abilities of human brains newer approaches take inspiration from a wider range of biological structures that that are capable of autonomous self organization Examples of these new approaches include evolutionary computation and evolutionary electronics artificial neural networks immune systems biorobotics and swarm intelligence to mention only a few This book offers a comprehensive introduction to the emerging field of biologically inspired artificial intelligence that can be used as an upper level text or as a reference for researchers Each chapter presents computational approaches inspired by a different biological system each begins with background information about the biological system and then proceeds to develop computational models that make use of biological concepts The chapters cover evolutionary computation and electronics cellular systems neural systems including neuromorphic engineering developmental systems immune systems behavioral systems including several approaches to robotics including behavior based bio mimetic epigenetic and evolutionary robots and collective systems including swarm robotics as well as cooperative and competitive co evolving systems Chapters end with a concluding overview and suggested reading

Geocomputation Robert J. Abrahart, Stan Openshaw, Linda M. See, 2003-09-02 Geocomputation is essentially the follow on revolution from Geographic Information Science and is expected to gather speed and momentum in the first decade of the 21st century It comes into use once a GIS database has been set up with a digital data library and expanded and linked to a global geographical two or three dimensional co ordinate system It exploits developments in IT and new data gathering and earth observing technologies and takes the notion of GIS beyond data and towards its analysis modelling and use in problem solving This book provides pointers on how to harness these technologies in tandem and in the context of multiple different subjects and problem areas It seeks to establish the principles and set the foundations for subsequent growth L

The Mathematica Journal, 1995 **Analogue and Numerical Modelling of Sedimentary Systems** Poppe de Boer, George Postma, Kees van der Zwan, Peter Burgess, Peter Kukla, 2009-01-26 Understanding basin fill evolution and the origin of stratal architectures has traditionally been based on studies of outcrops well and seismic data studies of and inferences on qualitative geological processes and to a lesser extent based on quantitative observations of modern and ancient sedimentary environments Insight gained on the basis of these studies can increasingly be tested and extended through the application of numerical and analogue forward models Present day stratigraphic forward modelling follows two principle lines 1 the deterministic process based approach ideally with

resolution of the fundamental equations of fluid and sediment motion at all scales and 2 the stochastic approach The process based approach leads to improved understanding of the dynamics physics of the system increasing our predictive power of how systems evolve under various forcing conditions unless the system is highly non linear and hence difficult or perhaps even impossible to predict The stochastic approach is more direct relatively simple and useful for study of more complicated or less well understood systems Process based models more than stochastic ones are directly limited by the diversity of temporal and spatial scales and the very incomplete knowledge of how processes operate and interact on the various scales The papers included in this book demonstrate how cross fertilization between traditional field studies and analogue and numerical forward modelling expands our understanding of Earth surface systems
