Natural Products of Woody Plants John W.

Rowe,1989-12-28 Wood as found in trees and bushes was of primary importance to ancient humans in their struggle to control their environment Subsequent evolution through the Bronze and Iron Ages up to our present technologically advanced society has hardly diminished the importance of wood Today its role as a source of paper products furniture building materials and fuel is still of major significance Wood consists of a mixture of polymers often referred to as lignocellulose The cellulose micro fibrils consist of an immensely strong linear polymer of glucose They are associated with smaller more complex polymers composed of various sugars called hemicelluloses These polysaccharides are embedded in an amorphous phenylpropane polymer lignin creating a remarkably strong composite structure the lignocellulosic cell wall Wood also contains materials that are largely extraneous to this lignocellulosic cell wall These extracellular substances can range from less than 10% to about 35% of the dry weight of the wood but the usual range is 2% 10% Among these components are the mineral constituents salts of calcium potassium sodium and other metals particularly those present in the soil where the tree is growing Some of the extraneous components of wood are too insoluble to be extracted by inert solvents and remain to give extractive free wood its color very often these are high molecular weight polyphenolics
