## **Paradigms For Fast Parallel Approximability:**

Paradigms for Fast Parallel Approximability Josep Díaz, 1997-07-10 Various problems in computer science are hard that is NP complete and so not realistically computable thus in order to solve them they have to be approximated This book is a survey of the basic techniques for approximating combinatorial problems using parallel algorithms Its core is a collection of techniques that can be used to provide parallel approximations for a wide range of problems for example flows coverings matchings travelling salesman problems graphs but in order to make the book reasonably self contained the authors provide an introductory chapter containing the basic definitions and results A final chapter deals with problems that cannot be approximated and the book is ended by an appendix that gives a convenient summary of the problems described in the book This is an up to date reference for research workers in the area of algorithms but it can also be used for graduate courses in the subject

Algorithmics for Hard Problems Juraj Hromkovič, 2013-03-14 Algorithmic design especially for hard problems is more essential for success in solving them than any standard improvement of current computer technologies Because of this the design of algorithms for solving hard problems is the core of current algorithmic research from the theoretical point of view as well as from the practical point of view There are many general textbooks on algorithmics and several specialized books devoted to particular approaches such as local search randomization approximation algorithms or heuristics But there is no textbook that focuses on the design of algorithms for hard computing tasks and that systematically explains combines and compares the main possibilities for attacking hard algorithmic problems As this topic is fundamental for computer science this book tries to elose this gap Another motivation and probably the main reason for writing this book is connected to education The considered area has developed very dynamically in recent years and the research on this topic discovered several profound re sults new concepts and new methods Some of the achieved contributions are so fundamental that one can speak about paradigms which should be included in the education of every computer science student Unfortunately this is very far from reality This is because these paradigms are not sufficiently known in the computer science community and so they are insufficiently communicated to students and practitioners

Sublinear Computation Paradigm Naoki Katoh, Yuya Higashikawa, Hiro Ito, Atsuki Nagao, Tetsuo Shibuya, Adnan Sljoka, Kazuyuki Tanaka, Yushi Uno, 2021-10-19 This open access book gives an overview of cutting edge work on a new paradigm called the sublinear computation paradigm which was proposed in the large multiyear academic research project Foundations of Innovative Algorithms for Big Data That project ran from October 2014 to March 2020 in Japan To handle the unprecedented explosion of big data sets in research

industry and other areas of society there is an urgent need to develop novel methods and approaches for big data analysis To meet this need innovative changes in algorithm theory for big data are being pursued For example polynomial time algorithms have thus far been regarded as fast but if a quadratic time algorithm is applied to a petabyte scale or larger big data set problems are encountered in terms of computational resources or running time To deal with this critical computational and algorithmic bottleneck linear sublinear and constant time algorithms are required The sublinear computation paradigm is proposed here in order to support innovation in the big data era A foundation of innovative algorithms has been created by developing computational procedures data structures and modelling techniques for big data The project is organized into three teams that focus on sublinear algorithms sublinear data structures and sublinear modelling The work has provided high level academic research results of strong computational and algorithmic interest which are presented in this book The book consists of five parts Part I which consists of a single chapter on the concept of the sublinear computation paradigm Parts II III and IV review results on sublinear algorithms sublinear data structures and sublinear modelling respectively Part V presents application results The information presented here will inspire the researchers who work in the field of modern algorithms

The Theory of Computation Bernard M. E. Moret,1998 Taking a practical approach this modern introduction to the theory of computation focuses on the study of problem solving through computation in the presence of realistic resource constraints The Theory of Computation explores questions and methods that characterize theoretical computer science while relating all developments to practical issues in computing The book establishes clear limits to computation relates these limits to resource usage and explores possible avenues of compromise through approximation and randomization The book also provides an overview of current areas of research in theoretical computer science that are likely to have a significant impact on the practice of computing within the next few years
