**Recent Advances in Science and Technology of Materials** Adlai Bishay, 2013-05-14 *Recent Advances in Science and Technology of Materials* Adlai Bishay, 1974-11-01 If an ion in a crystal is replaced by an impurity ion with a different charge compensation for the charge difference must be accomplished This is usually done by an intrinsic defect i e a lattice vacancy or interstitial host ion in such a way to balance the excess or deficit of charge The introduction of cation vacancies along with divalent cation impurities in alkali halides is a familiar example If these crystals are carefully annealed nearly all of the compensating defects migrate to the impurity ions to form impurity defect complexes It is the behavior of these complexes that are the principal concern in this paper Almost invariably such complexes are dipolar in character and when subjected to an electric or mechanical stress field they will tend to realign to an orientation of lower energy provided the thermal activation is sufficiently great If the complex consists of an impurity vacancy couple re orientation may occur either by the vacancy moving around the impurity or by an exchange of positions of the partners In general the activation energy for these two distinct reorientation paths is different If the complex consists of an impurity interstitial couple interchange of positions is unlikely and reorientation is considered to occur exclusively by the motion of the interstitial around the vacancy
