

Comprehensive Guide to the Cardiovascular System

Circulatory Circuits

The cardiovascular system comprises two primary circuits: the **pulmonary circuit** and the **systemic circuit**. The pulmonary circuit moves blood from the **right side of the heart** to the **lungs** for gas exchange and back to the **left side of the heart**. This pathway ensures oxygenation of blood and removal of carbon dioxide. The systemic circuit transports blood from the **left side of the heart** through the **arteries** to the **head, limbs, and organs**, then returns via **veins** to the **right side of the heart**. This circulation supplies oxygen and nutrients to tissues and removes metabolic wastes, maintaining homeostasis.

Types of Blood Vessels

Blood vessels are classified into three main types based on structure and function:

- **Arteries:** Carry blood away from the heart; have thick, elastic walls to withstand high pressure.
- **Veins:** Return blood to the heart; have thinner walls, larger lumens, and valves to prevent backflow.
- **Capillaries:** Microscopic vessels with only a single endothelial layer; facilitate exchange of gases, nutrients, and wastes between blood and tissues.

Differences Between Arteries and Veins
