## Receptors Structure And Function:

*Receptors* Clare Stanford, Roger W. Horton, 2001 Given the number of exciting developments across the whole spectrum of receptor research in recent years the editors have not restricted themselves to one particular approach or class of receptors Thus the studies within range from G protein coupled surface receptors to the delivery of antisense DNA inside living cell systems A distinguished team of contributors cover these diverse areas identifying any difficulties likely to be encountered and appropriate steps to overcome them Wherever appropriate the theoretical basis of each topic is explained first so that the results emerging from the practical procedures can be fully understood Anyone with an interest in receptor structure and function will find this book an invaluable resource

**G Protein-Coupled Receptors** Jesus Giraldo, Jean-Philippe Pin, 2011-08-16 G protein coupled receptors GPCRs are the largest family of cell surface receptors with more than 800 members identified thus far in the human genome They regulate the function of most cells in the body and represent approximately 3% of the genes in the human genome These receptors respond to a wide variety of structurally diverse ligands ranging from small molecules such as biogenic amines nucleotides and ions to lipids peptides proteins and even light Ligands agonists and antagonists acting on GPCRs are important in the treatment of numerous diseases including cardiovascular and mental disorders retinal degeneration cancer and AIDS It is estimated that these receptors represent about one third of the actual identified targets of clinically used drugs The determination of rhodopsin crystal structure and more recently of opsin 1 and 2 adrenergic and A2A adenosine receptors provides both academia and industry with extremely valuable data for a better understanding of the molecular determinants of receptor function and a more reliable rationale for drug design GPCR structure and function constitutes a hot topic The book which lies between the fields of chemical biology molecular pharmacology and medicinal chemistry is divided into three parts The first part considers what receptor structures tell us about the mechanism of receptor activation Part II focuses on receptor function It discusses what the data from biophysical and mutational studies and the analysis of the interactions of the receptor with ligands and regulator proteins tell us about the process of signal transduction The final part on modelling and simulation details new insights on the link between structure and mechanism and their implications in drug design
