*Handbook of Shock Waves, Three Volume Set* Gabi Ben-Dor, Ozer Igra, Tov Elperin, 2000-10-18 The Handbook of Shock Waves contains a comprehensive structured coverage of research topics related to shock wave phenomena including shock waves in gases liquids solids and space Shock waves represent an extremely important physical phenomena which appears to be of special practical importance in three major fields compressible flow aerodynamics materials science and astrophysics Shock waves comprise a phenomenon that occurs when pressure builds to force a reaction i e sonic boom that occurs when a jet breaks the speed of sound This Handbook contains experimental theoretical and numerical results which never before appeared under one cover the first handbook of its kind The Handbook of Shock Waves is intended for researchers and engineers active in shock wave related fields Additionally R D establishments applied science research laboratories and scientific and engineering libraries both in universities and government institutions As well as undergraduate and graduate students in fluid mechanics gas dynamics and physics Key Features Ben Dor is known as one of the founders of the field of shock waves Covers a broad spectrum of shock wave research topics Provides a comprehensive description of various shock wave related subjects First handbook ever to include under one separate cover experimental theoretical and numerical results

History of Shock Waves, Explosions and Impact Peter O. K. Krehl, 2008-09-24 This unique and encyclopedic reference work describes the evolution of the physics of modern shock wave and detonation from the earlier and classical percussion The history of this complex process is first reviewed in a general survey Subsequently the subject is treated in more detail and the book is richly illustrated in the form of a picture gallery This book is ideal for everyone professionally interested in shock wave phenomena

Dynamic Research by Optical Methods held on May 25 26 1970 in the Department of Mechanical and Aerospace Engineering at Syracuse University The contents focus on experimental and analytical aspects of contemporary optical methods as applied in modern research on high speed and or high temperature gaseous flows State of the art recent research results and possible research applications of spectroscopy spectral interferometry pulse laser holographic interferometry laser as a diagnostic and plasma generating tool and the analysis of plasma by light scattering constitute part of the subject matter of this volume The emerging importance and impact of recent laser developments on optical diagnostics of gas dynamic and gas physics phenomena is a recurring theme throughout the volume Diverse applications of the shock tube to process gases to high temperature equilibrium conditions and the study of important characteristics of these radiating gases by contemporary spectroscopic methods are discussed in papers by Nicholls Wurster and Wares et al Refractivity index measurements have long been extensively used for investigating gas dynamic and aerodynamic flows However the recent availability of the laser as a light source has brought significant improvements in the more conventional optical methods such as schlieren photography and interferometry as reported here in Alcock s paper More recent laser developments have resulted in several completely new optical diagnostic methods
