Why would a shell be so hard? The shells
of many gastropods that live on the seabed
are made of a hard material called calcium
carbonate. This hard shell helps protect
the animal from predators and helps it
keep its shape in the water.

Why are the gastropod shells with ribs, tubercles,
spines, and bumps here in common? They
make it difficult for shell breakers such as crabs,
lobsters, fish, and birds to do their work. But
only does this elaborate shell sculpture protect
the gastropod, it also helps them stay upright.
