Patent Application Experimental Engines and Electric Devices: Over 300 Drawings, 2024-08-12 Experimental Engines and Electric Devices Over 300 Patent Application Drawings of Engines and Electric and other Devices by Daniel Izzo 2024

THE COVER Figure 33b Polarization of Cosmic Radio Signals at Various Frequencies Cosmic radio signals originating from distant regions of the universe can exhibit polarization when observed at specific frequencies This paper explores the fascinating phenomenon of cosmic radio signal polarization at various frequencies including 91 MHz FM radio 160 MHz VHF radio and 610 MHz UHF TV channel 78 We delve into the methods used to polarize these signals and examine known cosmic radio sources Additionally we discuss the intriguing notion of naturally emitted radio pulses from celestial objects RBT and energy The patent describes several devices intended to generate energy or improve efficiency in various ways Here s an analysis of whether these devices might save money on energy usage

- 1 Thermionic Electron Electric Generator How it Works This device converts heat energy into electrical energy It uses a combination of materials like thorium tungsten cesium and cobalt magnets to generate an amplified electric output Energy Efficiency The concept of amplifying a small input of energy into a larger output could theoretically save money by reducing the need for external energy sources However the practicality of this in a real world scenario depends on the efficiency of the conversion process and the costs associated with the materials and maintenance
- 2 Microwave Hot Water Boiler Heating System How it Works This system converts energy from thorium uranium into microwave energy to heat water The patent suggests that the device can achieve a higher energy output compared to its input Energy Efficiency If the system can indeed produce more energy than it consumes it could reduce heating costs However the use of radioactive materials like thorium and uranium brings safety concerns regulatory issues and potential high initial costs which could offset any energy savings
- 3 Hydraulic Leverage Engine How it Works This engine uses a small input of energy to create a larger mechanical output through a system of pistons and levers Energy Efficiency The idea of multiplying a small energy input to achieve a greater output suggests potential for energy savings especially in applications requiring significant mechanical work However the real world efficiency of such a system depends on the engineering and the specific applications
- 4 Artificial Muscle Robot and Other Robotic Systems How it Works These robots are powered by artificial muscles that expand and contract using electrical energy They are designed to perform tasks that could otherwise be energy intensive if done by traditional machines or humans Energy Efficiency These systems could save energy if they are used to automate tasks more efficiently than human labor or conventional machines The effectiveness and energy savings would depend on the specific applications and the efficiency of the robotic systems

General Considerations Initial Costs vs Long Term Savings The devices described in the patent involve advanced and potentially expensive materials and technologies The initial setup costs might be high which could negate some of the energy savings

unless the systems are highly efficient and durable Practicality and Scalability The effectiveness of these devices in saving energy depends on how practically they can be implemented at scale Some of the technologies mentioned e g the use of radioactive materials could be difficult to deploy widely due to safety and regulatory concerns Conclusion Some of the devices described in the patent could theoretically save money on energy usage if they perform as described and if the initial costs and safety concerns are manageable However the actual savings would depend on many factors including the efficiency of the devices the cost of implementation and the specific applications they are used for Further research development and testing would be necessary to determine their viability in real world scenarios
