

The Lymphatic System

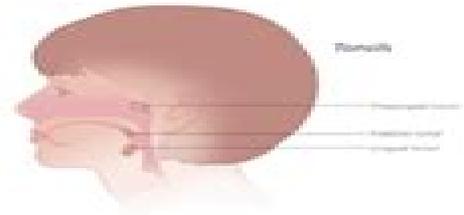

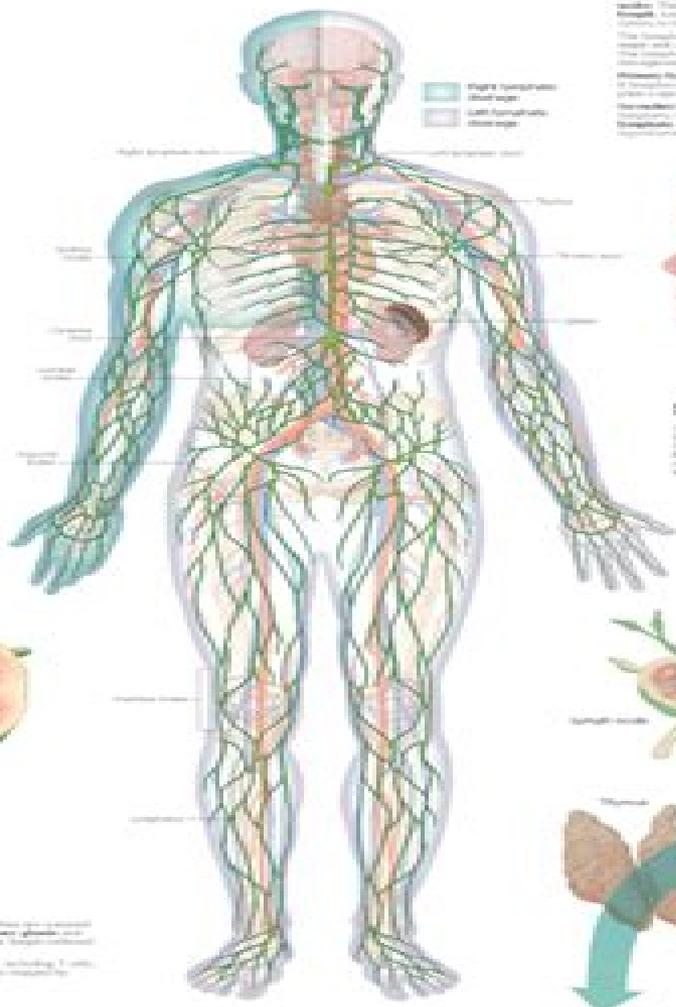

What is the lymphatic system?

The lymphatic system is a network of vessels and organs that help fight infection and remove toxins from the body. It is part of the immune system and is responsible for the production and transport of lymphocytes. The lymphatic system is made up of lymph nodes, lymph vessels, and lymphoid organs. It is a closed system that does not have a pump like the heart. The lymphatic system is responsible for the transport of lymph, a fluid that contains white blood cells and other immune cells. It is also responsible for the transport of fats from the digestive system and the removal of excess fluid from the tissues.

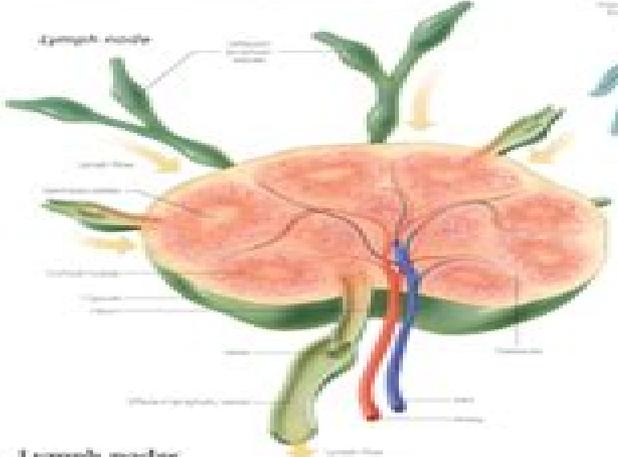

Lymph and lymph vessels

Lymph is a clear, colorless fluid that circulates through the lymphatic system. It is made up of water, proteins, and other substances. Lymph vessels are thin-walled vessels that carry lymph throughout the body. They are found in all parts of the body, including the skin, muscles, and organs. Lymph vessels are connected to the venous system at the neck and the abdominal cavity.

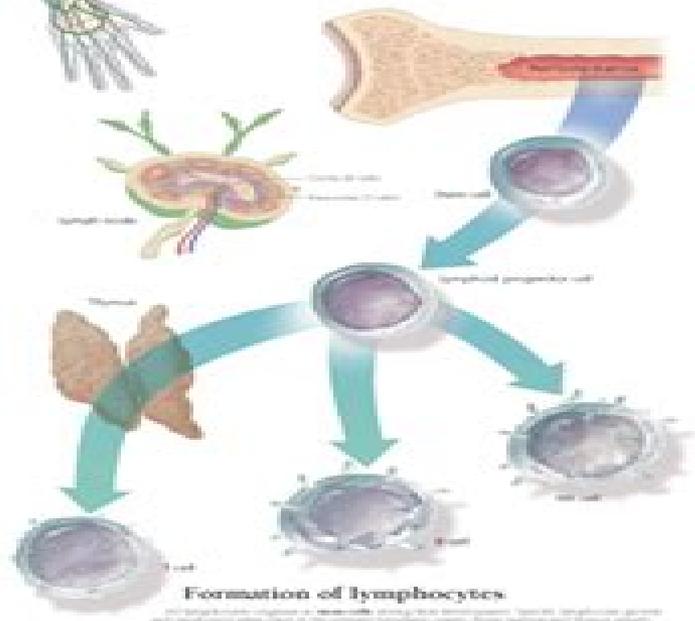

Lymphoid intestinal tissue

Lymphoid intestinal tissue is found in the lining of the digestive tract. It is responsible for the production and transport of lymphocytes. It is part of the immune system and is responsible for the defense of the body against infection. Lymphoid intestinal tissue is found in the tonsils, adenoids, and the lining of the stomach and intestines.

Lymph nodes

Lymph nodes are small, bean-shaped organs that are part of the lymphatic system. They are found throughout the body and are responsible for the production and transport of lymphocytes. Lymph nodes are found in the neck, armpits, and groin. They are also found in the lining of the digestive tract and the respiratory system.

Formation of lymphocytes

Lymphocytes are formed in the bone marrow from stem cells. They are then transported to the lymphatic system where they mature and become active. There are three main types of lymphocytes: B cells, T cells, and natural killer cells. B cells are responsible for the production of antibodies, while T cells are responsible for the destruction of infected cells. Natural killer cells are responsible for the destruction of cancer cells and other abnormal cells.

Inflammatory and immune responses

The lymphatic system plays a key role in the inflammatory and immune responses. It is responsible for the transport of immune cells to the site of infection and the removal of debris and toxins. The lymphatic system is also responsible for the production and transport of antibodies, which are proteins that help fight infection. The lymphatic system is a complex and essential part of the immune system.

Lymphatic system disorders

Lymphatic system disorders are conditions that affect the lymphatic system. They can be caused by a variety of factors, including infection, cancer, and genetic mutations. Lymphatic system disorders can lead to a variety of symptoms, including swelling, fatigue, and a weakened immune system. Some common lymphatic system disorders include lymphedema, lymphoma, and chronic lymphocytic leukemia.
