ORIGIN AND DEVELOPMENT

Psychodynamic therapy arises from the desire to better understand this part that the individuals are unaware of themselves.

Sigmund Freud (1856-1939) and his disciples founded psychoanalysis and contributed enormously to the development of psychotherapy as it is known today.

In the 1920s, psychoanalysis spread and produced elaborations from numerous theorists, among them Alfred Adler, Carl Jung, Otto Rank, and Theodore Reich. Adler, for example, contributed the notion that the feeling of inferiority perceived by the individual is the cause of the neurosis.

Another important contribution to early psychoanalysis was Carl Jung. Jung (1893) emphasized the self as a psychological construct.

Freud's classical psychoanalytic theory and therapy were extended by the following schools: ["ego psychology", "object relations", "attachment theory", "self psychology", "psychology"] interpersonal and relational psychoanalysis.

OBJECTIVE OF PSYCHODYNAMIC THERAPY

Its objective is to contribute to the existence of a... **healthy balance**, and allowing entrenched psychological conflicts in the unconscious to be expressed and understood by the person, in order to reconcile with oneself and giving new meaning to old traumas, irrational fears, dysfunctional beliefs and frustrated desires.

In this way, pointing to the true psychological conflict that takes place between conscious and the unconscious, and not only the symptom, it is intended to address the various issues from the root forms of psychological discomfort and the behavioral patterns that bring us problems and that are consequence of mental phenomena that, despite being within us, we are unaware of.
