

# Comprehensive Guide to Aggression: Neural, Genetic, Evolutionary, Social, and Media Perspectives

## Limbic System and Aggression

The limbic system, including structures such as the amygdala, cingulate gyrus, hippocampus, thalamus, hypothalamus, and fornix, plays a crucial role in the regulation of emotional behavior. It is often associated with emotional responses, including aggression. The amygdala, in particular, is thought to be central in processing emotional stimuli and triggering aggressive responses. For example, Gospic et al (2011) used functional MRI (fMRI) to observe that when participants rejected an unfair monetary reward—a social provocation—there was a sharp increase in activity within the amygdala. This spike was less pronounced when participants were administered benzodiazepines, which suggests a strong link between amygdala activity, the autonomic nervous system, and aggressive behavior.

Neurotransmitters also influence aggression. Serotonin, an inhibitory neurotransmitter, reduces the likelihood of impulsive actions by decreasing neuronal excitability at the postsynaptic membrane. When serotonin levels are normal in the orbitofrontal cortex, they help regulate impulsive and emotional behaviors, including aggression (Denson et al, 2012). Lower serotonin levels have been associated with increased impulsivity and aggression, as Virkkunen et al (1994) found that non-violent offenders often have lower serotonin levels. Furthermore, serotonin's role extends to regulating sleep patterns; lower serotonin levels are linked with sleep disturbances and impulsivity, which can indirectly influence aggressive tendencies.
