1. Four Early Mechanical Calculators

- **Abacus:** While not strictly mechanical in the modern sense, the abacus is one of the earliest calculating tools. It uses beads on rods to represent numbers. Users manipulate the beads to perform arithmetic operations like addition, subtraction, multiplication, and division.
- **Napier's Bones:** Invented by John Napier in 1617, these were a set of numbered rods that could be combined to perform multiplication and division. The rods were arranged in a specific way, and the results could be read directly from the intersections.
- **Pascaline:** Created by Blaise Pascal in 1642, the Pascaline was one of the first mechanical adding machines. It used a series of toothed wheels to represent digits, and the wheels were connected in a way that allowed for carrying over values from one digit to the next.
- **Stepped Reckoner:** Developed by Gottfried Wilhelm Leibniz in 1673, the Stepped Reckoner was a more advanced calculating machine capable of performing multiplication and division as well as addition and subtraction. It used a system of stepped drums to represent numbers and a mechanism for carrying over values between digits.

2. Two Births of Modern Computing

- **The ENIAC (Electronic Numerical Integrator and Computer):** Developed in 1945, the ENIAC is often considered the first general-purpose electronic computer. It was massive, occupying an entire room, and was primarily used for military calculations. The ENIAC marked a significant step forward in computing technology, demonstrating the potential of electronic circuits for performing complex calculations at high speed.
- **The Transistor:** Invented in 1947, the transistor revolutionized electronics and computing. Transistors replaced vacuum tubes, which were bulky, unreliable, and consumed a lot of power. Transistors were smaller, more efficient, and more reliable, making it possible to build smaller, faster, and more affordable computers. The transistor is a fundamental component of modern electronics and has been essential to the development of computers and other digital devices.

3. Three Early Electronic Computers

- **ENIAC (Electronic Numerical Integrator and Computer):** As mentioned previously, the ENIAC was one of the first general-purpose electronic computers. It was developed in 1945 and was primarily used for military calculations. Despite its size and complexity, the ENIAC demonstrated the potential of electronic computing and laid the groundwork for future developments.
- **Manchester Baby:** This experimental computer was developed in 1948 at the University of Manchester in England. It was one of the earliest stored-program computers, meaning that it could store instructions in its memory and execute them sequentially. The Manchester Baby was a significant milestone in the history of computing as it demonstrated the feasibility of storing programs electronically.
