Research Directions In Parallel Functional Programming:

Research Directions in Parallel Functional Programming Kevin Hammond, Greg Michaelson, 2012-12-06 Programming is hard Building a large program is like constructing a steam locomotive through a hole the size of a postage stamp An artefact that is the fruit of hundreds of person years is only ever seen by anyone through a 100 line window In some ways it is astonishing that such large systems work at all But parallel programming is much much harder There are so many more things to go wrong Debugging is a nightmare A bug that shows up on one run may never happen when you are looking for it but unfailingly returns as soon as your attention moves elsewhere A large fraction of the program s code can be made up of marshalling and coordination algorithms The core application can easily be obscured by a maze of plumbing Functional programming is a radical elegant high level attack on the programming problem Radical because it dramatically eschews side effects elegant because of its close connection with mathematics high level because you can say a lot in one line But functional programming is definitely not yet mainstream That s the trouble with radical approaches it s hard for them to break through and become mainstream But that doesn t make functional programming any less fun and it has turned out to be a wonderful laboratory for rich type systems automatic garbage collection object models and other stuff that has made the jump into the mainstream

Research Directions in Parallel Functional Programming Kevin Hammond, 1999-11 This volume provides a state of the art survey of research trends in parallel functional programming The text is divided into two sections the first section gives comprehensive introductions to key issues such as foundations programming constructs proof architectures and implementations the second comprises shorter summaries of research areas which are either of particular interest at the moment or which promise to provide key developments in the near future Topics covered here include coordination languages performance monitoring data flow programming explicit parallelism BSP and cost modelling Contributions have been commissioned by key researchers and practitioners in the area including several from the US and Canada where this is an area of increasing interest Research Directions in Parallel Functional Programming will be of interest to researchers post graduate students and practitioners in all relevant areas

Explicit and Implicit Parallel Functional Programming Jost Berthold, 2010-07 This book investigates the relation between the two conflicting goals of explicitness and abstraction for the implementation of parallel functional languages and skeletons The first part describes the implementation of the parallel Haskell extension Eden in layers of increasing abstraction The author derives a minimal monadic sublanguage for elementary parallel coordination and discusses a generic runtime system for parallel computations major parts of which are Haskell The second main part concentrates on parallel skeletons abstract algorithmic patterns with parallel implementation Exemplarily the author discusses implementations for data parallel skeletons map map reduce Google MapReduce and for topology skeletons which describe interaction and communication in regularly structured process networks The book is an in depth study of parallel functional programming both for researchers interested in the first part and for professionals seeking new impulses for practical development of parallel programs It shows that functional languages provide a suitable abstraction level to reason about parallel programming and to circumvent its complexity
