Perspectives in Artificial Intelligence José Cuena, John A. A. Campbell, **Intelligent Systems** Zbigniew Raś, Maria Zemankova, 1990 *New Technical Books* New York Public Library, 1991 Choice, 1990 **Organizational and Social Perspectives on Information Technology** Richard Baskerville, Jan Stage, Janice I. DeGross, 2013-03-14 The articles in this book constitute the proceedings papers from the IFIP WG 8.2 Working Conference IS2000 The Social and Organizational Perspective on Research and Practice in Information Technology held June 10-12 2000 in Aalborg Denmark The focus of the conference and therefore this book is on the basic aim of the working group namely the investigation of the interrelationships among four major components information systems IS information technology IT organizations and society This basic social and organizational perspective on research and practice in information technology may have evolved substantially since the founding of the group for example increasing the emphasis on IS development The plan for the conference was partially rooted in the early WG 8.2 traditions in which working conferences were substantially composed of invited papers For IS2000 roughly half of the paper presentations were planned to be invited the remaining half were planned to be double blind refereed in response to a Call For Papers Invited papers were single blind reviewed in order to provide the authors with pre publication feedback and comments along with the opportunity to revise their papers prior to its final incorporation in this book **Artificial Intelligence. An International Perspective** Max Bramer, 2009-09-19 Artificial Intelligence AI is a rapidly growing inter disciplinary field with a long and distinguished history that involves many countries and considerably pre dates the development of computers It can be traced back at least as far as Ancient Greece and has evolved over time to become a major subfield of computer science in general This state of the art survey not only serves as a position paper on the field from the viewpoint of expert members of the IFIP Technical Committee 12 its Working Groups and their colleagues but also presents overviews of current work in different countries The chapters describe important relatively new or emerging areas of work in which the authors are personally involved including text and hypertext categorization autonomous systems affective intelligence AI in electronic healthcare systems artifact mediated society and social intelligence design multilingual knowledge management agents intelligence and tools intelligent user profiling and supply chain business intelligence They provide an interesting international perspective on where this significant field is going at the end of the first decade of the twenty first century **Intelligent Spatial Decision Support Systems** Yee Leung, 2012-12-06 In the past half century we have experienced two major waves of methodological development in the study of human behavior in space and time The first wave was the well known quantitative revolution which propelled geography from a mainly descriptive discipline to a scientific discipline using formalism such as probability statistics and a large number of mathematical methods for analyzing spatial structures and processes under certainty and uncertainty The second wave is the recent advancement of geographical information systems which equips geographers with automation in the storage retrieval analysis and display of data Both

developments have significant impacts on geographical studies in general and solutions to real life spatio temporal problems in particular They have found applications in urban and regional planning automated mapping and facilities management transportation planning and management as well as environmental planning and management to name but a few examples Both developments have one thing in common They one way or the other use computer to process and analyze data However not until recently there has been very little interaction between the two Quantitative models have largely been developed independent of the underlying data models and structures representing the spatial phenomena or processes under study Display of analysis results has been primitive in terms of the utilization of computer graphic technologies Formal models in addition to their technical difficulties have poor capability in communication with users Geographical information systems on the other hand have originally been developed with a slight intention to entertain powerful analytical models

This book, written by authors with more than a decade of experience in the design and development of artificial intelligence (AI) systems in medical imaging, will guide readers in the understanding of one of the most exciting fields today. After an introductory description of classical machine learning techniques, the fundamentals of deep learning are explained in a simple yet comprehensive manner. The book then proceeds with a historical perspective of how medical AI developed in time, detailing which applications triumphed and which failed, from the era of computer-aided detection systems on to the current cutting-edge applications in deep learning today, which are starting to exhibit on-par performance with clinical experts. In the last section, the book offers a view on the complexity of the validation of artificial intelligence applications for commercial use, describing the recently introduced concept of software as a medical device, as well as good practices and relevant considerations for training and testing machine learning systems for medical use. Open problematics on the validation for public use of systems, which by nature continuously evolve through new data, is also explored. The book will be of interest to graduate students in medical physics, biomedical engineering, and computer science, in addition to researchers and medical professionals operating in the medical imaging domain who wish to better understand these technologies and the future of the field.
