Self Tuning Control For Two Dimensional Processes:

Self-Tuning Control for Two-Dimensional Processes W. P. Heath, 1994-09-06 Despite the complexity of two dimensional systems theory Heath demonstrates how simple algorithms can be achieved via a solution of a specific Diophantine equation Develops least squares optimal prediction minimum variance control and generalized minimum variance control algorithms for two dimensional CARMA processes Introduces a forgetting strategy that forgets in two dimensions Considers the problems of setpoint tracking and offset handling for self tuning controllers

Self-tuning Control for Two-dimensional Processes William Paul Heath, 1994 *Adaptive Systems in Control and Signal Processing* 1989 T.S. Durrani, D.H. Owens, M.A. Johnson, M.J. Grimble, 2014-06-28 The Symposium covered three major areas adaptive control identification and signal processing In all three new developments were discussed covering both theoretical and applications research Within the subject area of adaptive control the discussion centred around the challenges of robust control design to unmodelled dynamics robust parameter estimation and enhanced performance from the estimator while the papers on identification took the theme of it being a bridge between adaptive control and signal processing The final area looked at two aspects of signal processing recursive estimation and adaptive filters

Multidimensional Signals, Circuits and Systems Krzysztof Galkowski, Jeff David Wood, 2001-05-10 Although research on general multidimensional systems theory has been developing rapidly in recent years this is the first research text to appear on the subject since the early 1980s The text describes the current state of the art nD systems and sets out a number of open problems and gives several different perspectives on the subject It presents a number of different solutions to major theoretical problems as well as some interesting practical results The book comprises of a selection of plenary and other lectures given at The First International Workshop on Multidimensional nD Systems NDS 98 held in 1998 in Poland and is written by leading world specialists in the field

Identification and Control of Sheet and Film Processes Andrew P. Featherstone, Jeremy G. VanAntwerp, Richard D. Braatz, 2012-12-06 Sheet and film processes include coating papermaking metal rolling and polymer film extrusion Products produced by these processes include paper bumper stickers plastic bags windshield safety glass and sheet metal The total capitalization of industries that rely on these processes is well over 500 billion worldwide These processes are notorious for being difficult to control The goal of this book is to present the theoretical background and practical techniques for the identification and control of sheet and film processes It is explained why many existing industrial control systems perform poorly for sheet and film processes Identification and control algorithms are described and illustrated which provide consistent and reliable product quality These algorithms include an experimental design technique that ensures that informative data are collected during input output experimentation model identification techniques that produce a process model and an estimate of its accuracy and control techniques that take into account actuator constraints as well as robustness to model uncertainties The algorithms covered in this book are truly the state of the art Variations on some of the

algorithms have been implemented on industrial sheet and film processes Other algorithms are in various stages of implementation All of the algorithms have been applied to realistic simulation models constructed from industrial plant data many of these studies are included in this book Industrial Manufacturing Cornelius T. Leondes,2000-01-10 The Technical Committee on Mechatronics formed by the International Federation for the Theory of Machines and Mechanisms in Prague Czech Republic adopted the following definition for the term Mechatronics is the synergistic combination of precision mechanical electronic control and systems thinking in the design products and manufacturing process Due to developments in powerful computers including microprocessors and Application Specific Integrated Circuits ASICS computational techniques diverse technologies advances in the design process of products and other factors the field of mechatronics has evolved as a highly powerful and most cost effective means for product realization *Adaptive Systems in Control and Signal Processing, 1998* Robert R. Bitmead,Michael A. Johnson,Michael J. Grimble,2000 Adaptive Systems have been studied for a substantial period as the logical intersection between modelling and design in control and signal processing Because of this adaptive systems studies need to live in these two worlds while introducing concepts of their own These reflect the requirements to track significant system variations or to eliminate initial parameter uncertainty all the while maintaining satisfactory transient performance Historically Adaptive Systems and notably Adaptive Control have been the subject of takeover bids by neighbouring tribes from fields such as gain scheduling identification robust design or nonlinear systems The response to this has been to add impetus to the understanding of the connections between these disciplines and adaptation leading in turn to improvements of theory and practice We would appear to be currently in a period where there are increasing contacts being made with fields such as Learning Systems Computer Architectures and Identification Rather than hostile takeovers these have helped to expand the capability of Adaptive systems dramatically In this IFAC Workshop on Adaptive control and Signal Processing a wide range of papers expressing the large number of fronts on which adaptive systems are developing has been drawn together Linear Prediction Theory Peter Strobach,2012-12-06 Lnear prediction theory and the related algorithms have matured to the point where they now form an integral part of many real world adaptive systems When it is necessary to extract information from a random process we are frequently faced with the problem of analyzing and solving special systems of linear equations In the general case these systems are overdetermined and may be characterized by additional properties such as update and shift invariance properties Usually one employs exact or approximate least squares methods to solve the resulting class of linear equations Mainly during the last decade researchers in various fields have contributed techniques and nomenclature for this type of least squares problem This body of methods now constitutes what we call the theory of linear prediction The immense interest that it has aroused clearly emerges from recent advances in processor technology which provide the means to implement linear prediction algorithms and to operate them in real time The practical effect is the occurrence of a new class of high performance adaptive systems

for control communications and system identification applications This monograph presumes a background in discrete time digital signal processing including Z transforms and a basic knowledge of discrete time random processes One of the difficulties I have encountered while writing this book is that many engineers and computer scientists lack knowledge of fundamental mathematics and geometry
