Modified Cyclodextrins for Chiral Separation

Wei-hua Tang, Siu-Choon Ng, Dongping Sun, 2013-05-24 Modified Cyclodextrins for Chiral Separation offers a review of the latest advances in developing modified cyclodextrins as chiral selectors for various chromatographic and electromigration techniques Over the years many descriptions of chiral separation have appeared in academic journals and books but most of them have been devoted to either the development of analytical methods and protocols or the summary of different chiral selectors including cyclodextrins for chiral separation applications This is in marked contrast to this volume which focuses on the research endeavors concerning the development of cyclodextrin derivatives specifically as either chiral mobile phases for capillary electrophoresis or chiral stationary phases for various chromatographic techniques including gas chromatography or high performance liquid chromatography and supercritical fluid chromatography The ongoing thread in this book is the synthesis of structurally defined cyclodextrin derivatives and their applications in enantiomer separation by means of different analytical techniques Modified Cyclodextrins for Chiral Separation is intended for those who are interested in expanding their knowledge of cyclodextrin chemistry and chiral separation and in what cyclodextrin modification can be made to suit the needs of chiral selectors for different analytical techniques It primarily focuses on the state of the art cyclodextrin chemistry which is the basis for all chiral selectors used in these chiral separation techniques Wei-hua Tang PhD is a professor at the Key Laboratory of Soft Chemistry and Functional Materials Ministry of Education Nanjing University of Science and Technology China Siu Choon Ng PhD is a professor at the Division of Chemical and Biomedical Engineering

Potential for Modified Cyclodextrins (CD) to Alter the Disposition of Drug in the Body Anne Thanh Nguyen, 2010

Ist Christus nicht der erste und erhabenste Demokrat, 1850 **Cyclodextrin Chemistry** Myron L. Bender, Makoto

Komiyama, 1978 Chemistry was at one time completely described in terms of collision theory in which one molecule collided with another sometimes producing reaction Then came the realization that enzymes which are highly efficient catalysts work by way of prior complexation often stereospecific which is then followed by chemical reaction Thus systems that exhibit host guest relationships i.e. that show complexing are being looked at an ever increasing frequency The cyclodextrins are the first and probably the most important example of compounds that exhibit complex formation This is a book about the cyclodextrins There are of course other compounds that exhibit host guest relationships and thus bind other organic molecules but so far they have not achieved the importance of the cyclodextrins By their name it is obvious that cyclodextrins are cyclic compounds The complexes that they form are therefore cyclic inclusion complexes Because the complexes are cyclic in nature complexation can be very strong as opposed to 1t complex electrostatic or apolar complexes in which complex formation is two dimensional rather than three dimensional Cyclodextrins turn out to be excellent models of enzymes This is probably not fortuitous because they were first sought since it was discovered that the principal binding in the enzyme chymotrypsin was a cyclic inclusion complex Cyclodextrins can do more than form cyclic inclusion complexes they can catalyze as well But catalysis always occurs after complex formation

and Modified Cyclodextrins as Artificial Enzymes Hongping Ye,1992 **The Preparation of Novel Modified Cyclodextrins and Their Application in Enantioseparations by Gas Chromatography** Sheree N. Allen,2010

Since biological processes depend on the stereospecific creation and conversion of chiral molecules each enantiomer of a molecule can have a different biological effect While numerous synthetic drugs are sold in racemic form for reasons of cost and convenience in many cases one of the two enantiomers of a drug will cause undesirable and perhaps even devastating effects Therefore effective methods for the separation and quantification of enantiomers are of great importance Enantiomers can be separated only with the use of systems containing an optically active chiral selector Modified cyclodextrins CDs are widely used as chiral selectors by virtue of their ability to form inclusion complexes Because of the remarkably high efficiency and sensitivity of chiral gas chromatography GC chiral separations by this method represent a preferred method for enantiomer analysis The basic property of CDs that allows them to be successful for enantiomer separations is their ability to form selective inclusion complexes with a wide variety of organic molecules The preparation and application of modified cyclodextrins for the GC separation of enantiomers is a focal point of this research In effort to identify useful new derivatives modifications involving unique and separate reaction of the secondary hydroxyl groups and or annulations bridging the secondary oxygens have been examined Several new cyclodextrin derivatives e g per 6 OTBS 2 3 O diformyl beta CD per 6 OTBS 2 3 O cyclodimethylsilyl beta CD per 6 deoxy 2 3 O cyclodimethylsilyl beta CD and a mixed formyl acetyl phase have been synthesized and evaluated as components of stationary phases for capillary GC The efficiency of each new phase to separate enantiomers was evaluated against a 30 analyte panel to evaluate the influence of the different substituents on the selectivity These enantioseparations were also compared to those observed on four commercially available chiral phases using the same 30 analyte panel Overall this work resulted in nine new CD derivatives and the discovery of a new chiral selector that is comparable in efficiency to what is currently commercially available

Advances in Fluorescence Sensing Technology ,1997 Multiple Recognition by Modified Cyclodextrins Carolyn Anne Haskard,1996 This thesis studies the B cyclodextrins which are modified at the primary rim to incorporate an additional coordination or hydrophobic recognition site The natural organic host cyclodextrin and its chemically modified derivatives are utilised as hosts for the inclusion of a range of guests The study contributes to understanding the fundamental factors influencing selectivity of binding and the stability of the complexes formed when a guest is bound essentially at two recognition sites
