Molecular Recognition In Host Parasite Interactions:

Molecular Recognition in Host-Parasite Interactions Timo K. Korhonen, Tapani Hovi, P. Helena Mäkelä, 2012-12-06 A very early step in microbial colonization and pathogenesis is that involving recognition of the host by the microbe. In the final analysis such recognition is due to interaction between specific molecules on the two sides without which host and microbe would ignore each other. It is therefore exciting to learn the rules that govern host-microbe interaction. To a large extent, it determines whether or not we are infected by the microbe. At the molecular level, which influenza virus, leishmaniasis, staphylococci and other pathogens. This book is a compendium of the addresses delivered at a symposium on molecular interaction at Porvoo, Finland, in August 1991. Realizing that there are no a priori differences in receptor recognition in viruses, eukaryotic parasites and bacteria, we freely intermingled these microbes at the symposium and in this book. We found the interdisciplinary discussions and comparisons both educative and stimulating. Thus the book is divided into parts that focus on host cell receptors on microbial recognition molecules and molecules that mediate microbial interaction with a host cell receptor and briefly on the molecular events that follow. Although many microbes and many cellular receptors are missing from the book owing to the limited duration and size of the symposium, the articles presented here constitute an impressive body of examples of how initial host-microbe interaction can come about. We believe that as such the book is a useful and interesting overview of the mechanisms and principles involved in these interactions.

Immune Recognition and Evasion: Molecular Aspects of Host-Parasite Interaction L.H.T. Van Der Ploeg, 2012-12-02 *Immune Recognition and Evasion: Molecular Aspects of Host-Parasite Interaction* reviews recent advances in understanding the genetic basis of host-parasite interactions with emphasis on antigenic epitopes, the genetics of parasites, the molecular mechanisms of immune recognition and evasion and the way that cytokines and hormones act on host-parasite interactions. Organized into four parts encompassing 25 chapters, this volume begins with an overview of the genomic organization of the T cell receptor genes and the contribution of non-B DNA structures to switch recombination in immunoglobulin genes. It then discusses signal transduction by class II molecules encoded by the major histocompatibility complex Ia and the biological consequences of this process: allelic polymorphism of HLA class II antigens and its connection to the molecular basis of autoimmunity; mimicry between HLAB27 and bacteria; and genetic control of susceptibility to helminth infection. The reader is also introduced to recognition of protein antigens by antibodies; recognition of influenza antigens by class I-restricted cytotoxic T lymphocytes; the biochemical basis of cachexia of infection; mechanisms of antigenic variation in Plasmodium; and rational design of trypanocidal drugs. Geneticists and molecular biologists will gain valuable information from this book.

Host-Parasite Interactions Gert Flik, Geert Wiegertjes, 2004-07-01 This volume summarizes current research into the physiology and molecular biology of host-parasite interactions. Brought together by leading international experts in the field, the first section outlines fundamental processes followed by specific examples in the concluding section. Covering a wide range of organisms, *Host-Parasite Interactions* is
