Kowalik,2012-12-06 It has been widely recognized that artificial intelligence computations offer large potential for distributed and parallel processing Unfortunately not much is known about designing parallel AI algorithms and efficient easy to use parallel computer architectures for AI applications The field of parallel computation and computers for AI is in its infancy but some significant ideas have appeared and initial practical experience has become available The

purpose of this book has been to collect in one volume contributions from several leading researchers and pioneers of AI that represent a sample of these ideas and experiences This sample does not include all schools of thought nor contributions from all leading researchers but it covers a relatively wide variety of views and topics and in this sense can be helpful in assessing the state of the art We hope that the book will serve at least as a pointer to more specialized literature and that it will stimulate interest in the area of parallel AI processing It has been a great pleasure and a privilege to cooperate with all contributors to this volume They have my warmest thanks and gratitude Mrs Birgitta Knapp has assisted me in the editorial task and demonstrated a great deal of skill and patience Janusz S Kowalik vii INTRODUCTION Artificial intelligence AI computer programs can be very time consuming

Polychronopoulos,1988-08-31 The second half of the 1970s was marked with impressive advances in array vector architectures and vectorization techniques and compilers This progress continued with a particular focus on vector machines until the middle of the 1980s The majority of supercomputers during this period were register to register Cray 1 or memory to memory CDC Cyber 205 vector pipelined machines However the increasing demand for higher computational rates lead naturally to parallel computers and software Through the replication of autonomous processors in a coordinated system one can skip over performance barriers due technology limitations In principle parallelism offers unlimited performance potential Nevertheless it is very difficult to realize this performance potential in practice So far we have seen only the tip of the iceberg called parallel machines and parallel programming Parallel programming in particular is a rapidly evolving art and at present highly empirical In this book we discuss several aspects of parallel programming and parallelizing compilers Instead of trying to develop parallel programming methodologies and paradigms we often focus on more advanced topics assuming that the reader has an adequate background in parallel processing The book is organized in three main parts In the first part Chapters 1 and 2 we set the stage and focus on program transformations and parallelizing compilers The second part of this book Chapters 3 and 4 discusses scheduling for parallel machines from the practical point of view macro and microtasking and supporting environments Finally the last part Le *Parallel Computing in Science and Engineering*

Rüdiger Dierstein,Dieter Müller-Wichards,Hans-Martin Wacker,1988-05-11 It was the aim of the conference to present issues in parallel computing to a community of potential engineering scientific users An overview of the state of the art in several important research areas is given by leading scientists in their field The classification question is taken up at various points ranging from parametric characterizations communication structure and memory distribution to control and execution schemes Central issues in multiprocessing hardware and operation such as scalability techniques of overcoming memory latency and synchronization overhead as well as fault tolerance of communication networks are discussed The problem of designing and debugging parallel programs in a user friendly environment is addressed and a number of program transformations for enhancing vectorization and parallelization in a variety of program situations are described Two different algorithmic techniques for the solution of certain classes of partial differential equations are discussed The properties of domain decomposition algorithms and their mapping onto a CRAY XMP type architecture are investigated and an overview is given of the merit of various approaches to exploiting the acceleration potential of multigrid methods Finally an abstract performance modeling technique for the behavior of applications on parallel and vector architectures is described
