Multicomponent Flow Modeling Vincent Giovangigli, 2012-12-06 The goal of this is book to give a detailed presentation of multicomponent flow models and to investigate the mathematical structure and properties of the resulting system of partial differential equations These developments are also illustrated by simulating numerically a typical laminar flame Our aim in the chapters is to treat the general situation of multicomponent flows taking into account complex chemistry and detailed transport phe nomena In this book we have adopted an interdisciplinary approach that en compasses a physical mathematical and numerical point of view In par ticular the links between molecular models macroscopic models mathe matical structure and mathematical properties are emphasized We also often mention flame models since combustion is an excellent prototype of multicomponent flow This book still does not pretend to be a complete survey of existing models and related mathematical results In particular many subjects like multi phase flows turbulence modeling specific applications porous me dia biological models or magneto hydrodynamics are not covered We rather emphasize the fundamental modeling of multicomponent gaseous flows and the qualitative properties of the resulting systems of partial dif ferential equations Part of this book was taught at the post graduate level at the Uni versity of Paris the University of Versailles and at Ecole Poly technique in 1998 1999 to students of applied mathematics **American Book Publishing Record** ,2000
