Data Collection via Simulation

I would first like to say that I am a philosopher and this proposal was arrived at through philosophy. It seeks to propose a new method of training data collection. The method involves **creating a simulation** of sufficient granularity (\checkmark)/resolution, then **running that simulation** with highly tuned initial conditions in order to **produce a resulting system** where the desired **data phenomena** manifests.

I understand that this shall be easier said than done, but I believe that with today's and future technologies it can be in fact be realized. On the grandest scale, and more philosophically, this method can be used to create a simulation of all reasonably pertinent phenomena in our solar system and beyond, with sufficient hardware and design implementation. On a smaller scale it could easily be used to map the mere thousands of words in a given language.

This method also takes care of any intellectual property claims as the simulation arrived at such creations from mere initial conditions. I am not a legal professional however and this takes us to a boarder issue of how to handle IP in a simulation especially a generated one - not generated from training data but from initial parameters using the laws of physics and the universe.
