Research Grants Index National Institutes of Health (U.S.). Division of Research Grants,1971 **Neuronal Development** Nicholas C. Spitzer,2013-03-09 Studies of simple and emerging systems have been undertaken to understand the processes by which a developing system unfolds and to understand more completely the basis of the complexity of the fully formed structures The nervous system has long been particularly intriguing for such studies because of the early recognition of a multitude of distinctly differentiated states exhibited by nerve cells with different morphologies Anatomical studies suggest that one liver cell may be very like another but indicate that neurons come in a remarkable diversity of forms This diversity at the anatomical level has parallels at the physiological and biochemical levels It is becoming increasingly easy to characterize the different cellular phenotypes of neurons The repeatability with which these phenotypes are expressed may account in part for the specificity and reliability with which neurons form connections and it has allowed precise description of the first appearance and further development of the differentiated characteristics of individual neurons from relatively undifferentiated precursor cells This represents a major advance over our knowledge of development at the level of tissues and makes it feasible to define and address questions about the underlying molecular mechanisms involved Central to these advances has been the clear recognition that there is no single best preparation for the study of neuronal development Furthermore it has become evident that no single technique can tell us all we want to know

Mouse Brain Development Andre M. Goffinet,Pasko Rakic,2000-04-28 Our understanding of the molecular mechanisms involved in mammalian brain development remains limited However the last few years have witnessed a quantum leap in our knowledge due to technological improvements particularly in molecular genetics Despite this progress the available body of data remains mostly phenomenological and reveals very little about the grammar that organizes the molecular dictionary to articulate a phenotype Nevertheless the recent progress in genetics will allow us to contemplate for the first time the integration of observation into a coherent view of brain development Clearly this may be a major challenge for the next century and arguably is the most important task of contemporary developmental biology The purpose of the present book is to provide an overview that synthesizes up to date information on selected aspects of mouse brain development Given the format it was not possible to cover all aspects of brain development and many important subjects are missing The selected themes are to a certain extent subjective and reflect the interests of the contributing authors Examples of major themes that are not covered are peripheral nervous system development including myelination the development of the hippocampus and several other CNS structures as well as the developmental function of some important morphoregulatory molecules

Cellular and Molecular Biology of Neuronal Development Ira Black,2013-11-11 A central problem in neurobiology

concerns mechanisms that generate the profound diversity and specificity of the nervous system. What is the substance of diversification and specificity at the molecular, cellular, and systems levels? How, for example, do 10¹¹ neurons each form approximately 10¹¹ interconnections allowing normal physiological function? How does disruption of these processes result in human disease? These proceedings represent the efforts of molecular biologists, embryologists, neurobiologists, and clinicians to approach these issues. In this volume, they are grouped by subject to present the varieties. The chapters of methods used to approach each individual area. Section I deals with embryogenesis and morphogenesis of the nervous system. In Chapter 3, Weston and co-workers describe the use of monoclonal antibodies that recognize specific neuronal epitopes, including specific gangliosides, for the purpose of defining heterogeneity in the neural crest, an important model system. Immunocytochemical analysis reveals the existence of distinct subpopulations within the crest at extremely early stages; cells express neuronal or glial binding patterns at the time of migration. Consequently, interactions with the environment may select for predetermined populations. Le Douarin reaches similar conclusions in Chapter 1 by analyzing migratory pathways and developmental potentials in the crest of quail.

Abnormal Cortical Development and Epilepsy Roberto Spreafico, G. Avanzini, Frederick Andermann, 1999. Thanks to advanced imaging techniques, it is now possible to recognize in vivo structural alterations of the cortex leading in many patients to epileptic syndromes frequently resistant to pharmacological treatment. Areas analysed in this book are mechanisms of cortical development, animal models of neuronal migration disorders mimicking human pathology, electroclinical, neuroradiological, and neuropathological studies of the different forms of cortical dysplasia. This volume includes contributions from neurologists, epileptologists, neuropaediatricians, as well as paediatricians and neuroscientists stimulating a multidisciplinary discussion to improve diagnostic and therapeutic strategies.
