**Magnetic Monopoles** Yakov M. Shnir, 2006-03-30 One would be surprised if Nature had made no use of it P A M Dirac According to some dictionaries one meaning of the notion of beauty is symmetry Probably beauty is not entirely in the eye of the beholder It seemstoberelatedtothesymmetryoftheobject Fromaphysicalviewpoint this de nition is very attractive it allows us to describe a central concept of theoretical physics over the last two centuries as being a quest for higher symmetry of Nature The more symmetric the theory the more beautiful it looks Unfortunately our imperfect at least at low energy scale world is full of nasty broken symmetries This has impelled physicists to try to understand how this happens In some cases it is possible to reveal the mechanism of violationandhowthesymmetrymaybe recovered thenourpictureofNature becomes a bit more beautiful One of the problems of the broken symmetry that we see is that while there are electric charges in our world their counterparts magnetic mo poles have not been found Thus in the absence of the monopoles the s metry between electric and magnetic quantities is lost Can this symmetry be regained In the history of theoretical physics the hypothesis about the possible existence of a magnetic monopole has no analogy There is no other purely theoretical construction that has managed not only to survive without any experimental evidence in the course of more than a century but has also remained the focus of intensive research by generations of physicists

**Magnetic Monopoles** Richard A. Carrigan,W. Peter Trower, 2012-12-06 In 1269 Petrus Peregrinus observed lines of force around a lodestone and noted that they were concentrated at two points which he designated as the north and south poles of the magnet Subsequent observation has confirmed that all magnetic objects have paired regions of opposite polarity that is all magnets are dipoles It is easy to conceive of an isolated pole which J J Thomson did in 1904 when he set his famous problem of the motion of an electron in the field of a magnetic charge In 1931 P A M Dirac solved this problem quantum mechanically and showed that the existence of a single magnet pole anywhere in the universe could explain the mystery of charge quantization By late 1981 theoretical interest in monopoles had reached the point where a meeting was organized at the International Centre for Theoretical Physics in Trieste Many mathematical properties of monopoles were discussed at length but there was only a solitary account describing experiments This imbalance did not so much reflect the meeting s venue as it indicated the relative theoretical and experimental effort at that point

**Experimental Searches for Magnetic Monopoles. [Mass, Probability, Review].** ,1976 Analysis of the sensitivity of previous negative searches for magnetic monopoles shows that they constitute prior evidence against the monopole interpretation of the event reported as evidence for detection of a moving magnetic monopole The strength of the evidence

varies with the unknown mass of the monopole For  $M$  less than or equal to 105 GeV odds are greater than 106 1 against For larger masses the limits depend strongly on assumptions about the range of monopoles and the threshold for detection of monopole tracks in obsidian In no case are the odds less than 8 1 and they may be no less than 8000 1 against Since the reported event may also be due to an electrically charged heavy particle it is probably not due to a monopole
