## **Magnetism In Metals Metallic Compounds:**

*Magnetism in Metals and Metallic Compounds* Jan Lapuszanski, 2012-12-06 The Proceedings presented here contain the notes of lectures delivered during the Eleventh Winter School of Theoretical Physics held at Karpacz Poland February 19 March 4 1974 The School was primarily devoted to new concepts in the theory of magnetism in metals alloys and metallic compounds but as can be seen from the table of contents of the book other topics of the theory of magnetism were also discussed in the course of the lectures The organizers agreed to such a broadening of the scope in order to satisfy particular requests from the Polish participants for whose benefit the School was organized These local interests are clearly reflected in the Proceedings and are responsible for a certain inhomogeneity of the topics selected for presentation Nevertheless we have a strong hope that these materials will be interesting to many physicists not only in Poland for the subjects discussed here are important not only on the local level as the lectures contain quite fresh unpublished results or excellent up to date reviews The first part of the volume contains lectures directly corresponding to the title of the School i.e. selected topics of the theory of metallic magnetism with slight bias toward rare earth and actinide metals and their compounds In the second half we have collected the topics more loosely connected with the main stream such as statistical and thermodynamic aspects of various models spin phonon interaction and others

### **Magnetic Properties of Transition Metal Compounds**

R. L. Carlin, A. J. van Duyneveldt, 2012-12-06 This is a textbook of what is often called magnetochemistry We take the point of view that magnetic phenomena are interesting because of what they tell us about chemical systems Yet we believe it is no longer tenable to write only about such subjects as distinguishing stereochemistry from the measurement of a magnetic susceptibility over a restricted temperature region that is paramagnetism is so well understood that little remains to explore which is of fundamental interest The major purpose of this book is to direct chemists to some of the recent work of physicists and in particular to a lengthy exposition of magnetic ordering phenomena Chemists have long been interested in magnetic interactions in clusters but many have shied away from long range ordering phenomena Now however more people are investigating magnetic behavior at temperatures in the liquid helium region where ordering phenomena can scarcely be avoided The emphasis is on complexes of the iron series ions for this is where most of the recent work both experimental and theoretical has been done The discussion therefore is limited to insulating crystals the nature of magnetism in metals and such materials as semiconductors is sufficiently different that a discussion of these substances is beyond our purposes The book is directed more at the practical experimentalist than at the theoretician
