Chapter 2

Bilingualism and Intelligence

"YOU KNOW, I've always wondered. Is it good or bad for children to be bilingual?" This is the question I am most frequently asked. It comes up in my office with students and colleagues, at cocktail parties and during dinner conversations, at professional meetings of scholars and school teachers. My questioners often know of a child whose learning problems have been attributed to bilingualism. They have heard that using two languages in early childhood creates a split personality, a linguistic Jekyll and Hyde. Intellectually his experience with two language systems seems to have left him with a mental flexibility, a superiority in concept formation, a more diversified set of mental abilities. . . . In contrast, the monolingual appears to have a more unitary structure of intelligence which he must use for all types of intellectual tasks. (P. 20)

The primary objective of this chapter will be to look at the literature on "good" and "bad" bilingualism with respect to an elusive psychological construct called "intelligence." Since the turn of the century, psychologists have tried to develop objective instruments for measuring this construct, and researchers have used the performance of bilinguals on such measures as an indication of whether bilingualism is good or bad.

An overview of the hundreds of studies that compare the performance of bilinguals with monolinguals on various measures of intelligence reveals that research in the first half of this century was guided by the question of whether or not bilingualism has a negative effect on intelligence, while more recent work has been concerned with whether or not there is a positive effect. This shift in emphasis is related to the subject populations that were under study. The early work was conducted primarily in the United States with immigrant groups, and the recent work with middle-class populations in Canada and
