Study the past if you would divine the future CONFUCIUS A well written organized and concise survey is an important tool in any newly emerging field of study This present text is the first of a new series that has been established to promote the publications of such survey books A survey serves several needs Virtually every new research area has its roots in several diverse areas and many of the initial fundamental results are dispersed across a wide range of journals books and conferences in many different sub fields A good survey should bring together these results But just a collection of articles is not enough Since terminology and notation take many years to become standardized it is often difficult to master the early papers In addition when a new research field has its foundations outside of computer science all the papers may be difficult to read Each field has its own view of elegance and its own method of presenting results A good survey overcomes such difficulties by presenting results in a notation and terminology that is familiar to most computer scientists A good survey can give a feel for the whole field It helps identify trends both successful and unsuccessful and it should point new researchers in the right direction      *Parallel Processing, 1980 to 2020* Robert Kuhn, David Padua, 2020-10-14 This historical survey of parallel processing from 1980 to 2020 is a follow up to the authors 1981 Tutorial on Parallel Processing which covered the state of the art in hardware programming languages and applications Here we cover the evolution of the field since 1980 in parallel computers ranging from the Cyber 205 to clusters now approaching an exaflop to multicore microprocessors and Graphic Processing Units GPUs in commodity personal devices parallel programming notations such as OpenMP MPI message passing and CUDA streaming notation and seven parallel applications such as finite element analysis and computer vision Some things that looked like they would be major trends in 1981 such as big Single Instruction Multiple Data arrays disappeared for some time but have been revived recently in deep neural network processors There are now major trends that did not exist in 1980 such as GPUs distributed memory machines and parallel processing in nearly every commodity device This book is intended for those that already have some knowledge of parallel processing today and want to learn about the history of the three areas In parallel hardware every major parallel architecture type from 1980 has scaled up in performance and scaled out into commodity microprocessors and GPUs so that every personal and embedded device is a parallel processor There has been a confluence of parallel architecture types into hybrid parallel systems Much of the impetus for change has been Moore s Law but as clock speed increases have stopped and feature size decreases have slowed down there has been increased demand on parallel processing to continue performance gains In programming notations and compilers we observe that the roots of today s programming notations existed before 1980 And that through a great deal of research the most widely used programming notations today although the result of much broadening of these roots remain close to target system architectures allowing the programmer to almost

explicitly use the target's parallelism to the best of their ability. The parallel versions of applications directly or indirectly impact nearly everyone, computer expert or not, and parallelism has brought about major breakthroughs in numerous application areas. Seven parallel applications are studied in this book. *Operating System for Parallel Computing: Issues and Problems* Sabih Jamal, Muhammad Waseem, Muhammad Aslam, 2014-05-09 Seminar paper from the year 2014 in the subject Computer Science Theory grade A language English abstract. Parallel computing attempts to solve many complex problems by using multiple computing resources simultaneously. This review paper is intended to address some of the major operating systems design issues for shared memory parallel computers like SMPs. Parallel computers can be classified according to the level at which the architecture supports parallelism with multi-core and multi-processor computers. The paper proceeds by specifying key design issues of operating system like processes synchronization, memory management, communication, concurrency control, and scheduling in case of shared memory SMPs. It also elaborates some concerns of Linux scheduler for shared memory SMPs parallel computing. The basic objective of the paper is to provide a quick overview of problems that may arise in designing parallel computing operating system. The work features the development of the fundamental technologies for massively parallel processing, covering research on the applications, the language, the operating system, and the hardware architecture. Also, the present status and future plans are addressed. The following topics are discussed in the section on applications: the MGCG Method, Parallelization of FEM Modeling of Group Behaviors, Parallel Visualization, Functional Memory Type Parallel Processing, a Parallel Reduction Algorithm, and Combination Algorithm. As for the programming languages: the SIMD Based Language NCX, the Dataflow based Language V, and the Parallel Object

Oriented Language A NETL are discussed In the chapter on operating systems the subjects Design Philosophy and Objectives COS Software Architecture and Elements of the Operating System are amongst others addressed Finally the part on hardware architecture covers an Overview of the JUMP 1 System Memory Architecture Network Architecture I O Architecture and Implementation Issues Massively parallel processing is expected to play a crucial role in the development of almost all advanced technologies for the 21st century This book is intended to serve a large variety of researchers in the area of parallel computing
