

# GEOPHYSICAL METHODS OF EXPLORATION

## CORE DRILLING

Core drilling can be considered both a geological and geophysical exploration method and a form of fluid flow. The primary motivation for core drilling is the information and control of the subsurface. The information and control of the subsurface provides the backbone of geophysical exploration activities. Core drilling can be used flexibly to assess exploration areas that may be expected to be covered by seismic data. The core samples are processed and analyzed to determine and understand the physical properties of the subsurface, including porosity, permeability, and other geophysical parameters. Core samples are also used to determine the subsurface structure and to determine the subsurface structure of the subsurface. Core samples are also used to determine the subsurface structure of the subsurface.

## SEISMIC

Seismic exploration uses seismic waves to determine the subsurface structure of the subsurface. Seismic waves are generated by a seismic source and travel through the subsurface. The seismic waves are recorded by seismic receivers and processed to determine the subsurface structure. Seismic exploration is used to determine the subsurface structure of the subsurface. Seismic exploration is used to determine the subsurface structure of the subsurface.

## MAGNETIC TECHNIQUES

The magnetic method of geophysical exploration is used to determine the subsurface structure of the subsurface. The magnetic method is used to determine the subsurface structure of the subsurface. The magnetic method is used to determine the subsurface structure of the subsurface.

## ELECTRICAL TECHNIQUES

Electrical methods of geophysical exploration are used to determine the subsurface structure of the subsurface. The electrical method is used to determine the subsurface structure of the subsurface. The electrical method is used to determine the subsurface structure of the subsurface.

## REMOTE SENSING

Remote sensing methods involve the use of satellite imagery to determine the subsurface structure of the subsurface. Remote sensing is used to determine the subsurface structure of the subsurface. Remote sensing is used to determine the subsurface structure of the subsurface.

**SEISMIC DATA** - Seismic data is used to determine the subsurface structure of the subsurface. Seismic data is used to determine the subsurface structure of the subsurface. Seismic data is used to determine the subsurface structure of the subsurface.

*Methods and Techniques in Geophysics* S. K. Runcorn, 1960

**Use of Geophysics for Transportation Projects** Phil C. Sirles, National Cooperative Highway Research Program, 2006 TRB s National Cooperative Highway Research Program NCHRP Synthesis 357 Use of Geophysics for Transportation Projects examines the state of the practice regarding the use of geophysics for transportation projects The report focuses on who is using geophysics and why which methods and applications are the most commonly used the use of in house expertise compared with contracting private consultants and how geophysical service contracts are procured and implemented

*Electromagnetic Methods in Applied Geophysics* Misac N. Nabighian, 1988 As a slag heap the result of strip mining creeps closer to his house in the Ohio hills fifteen year old M C is torn between trying to get his family away and fighting for the home they love

**Applied Geophysics** W. M. Telford, L. P. Geldart, R. E. Sheriff, 1990-10-26 This is the completely revised and updated version of the popular and highly regarded textbook Applied Geophysics It describes the physical methods involved in exploration for hydrocarbons and minerals which include gravity magnetic seismic electrical electromagnetic radioactivity and well logging methods All aspects of these methods are described including basic theory field equipment techniques of data acquisition data processing and interpretation with the objective of locating commercial deposits of minerals oil and gas and determining their extent In the fourteen years or so since the first edition of Applied Geophysics many changes have taken place in this field mainly as the result of new techniques better instrumentation and increased use of computers in the field and in the interpretation of data The authors describe these changes in considerable detail including improved methods of solving the inverse problem specialized seismic methods magnetotellurics as a practical exploration method time domain electromagnetic methods increased use of gamma ray spectrometers and improved well logging methods and interpretation

*Geophysics in Engineering Investigations* P. W. McDowell, 2002 The full potential of geophysics in engineering investigations is still to be realised The many available techniques can provide important information about the ground its mass properties its small scale variations and its anomalies of structure or content The advantage of a geophysical survey is that it enables information to be obtained for large volumes of ground that cannot be investigated by direct methods due to cost The applications of geophysics in the characterisation of contaminated land are still developing but have great potential for example in the distribution and migration of pollutants in the ground and groundwater Geophysics is still insufficiently or inappropriately used in engineering and the newer capabilities are not appreciated so there is a need for up to date guidance about how to apply geophysical investigations This report is published in co operation with the Geological Society and presents a logical guide through the process of using geophysical investigation methods in site characterisation It explores the roles of geophysical methods and provides the background to geophysics as an investigative tool The procurement management and reporting frameworks for a geophysical investigation are set out and the importance of the involvement of a recognised

geophysics specialist adviser with the work is emphasised The report explains the need for a conceptual ground model to enable appropriate investigative methods to be chosen The underlying science and current practices of the main techniques are explained as well as the processes of data acquisition handling and presentation The different targets determinable by geophysical methods are considered in separate sections for geological geotechnical geo environmental and structural engineering applications The report concludes with recommendations for practice The guide is aimed at geotechnical and civil engineers geologists and engineering geologists specialist geophysics contractors consultants and clients
