Minimally Invasive Thoracic Surgery and the Potential Role in Advanced Staged Lung Cancer Karina Noboa Soden, Cornell University. Weill Cornell Graduate School of Medical Sciences, 2014 Problem Video assisted thoracoscopic surgery VATS is a minimally invasive technique that has become an acceptable standard surgical approach for early stage lung cancer In patients diagnosed with advanced stage non small cell lung cancer NSCLC thoracotomy remains the standard approach for anatomical resections Advantages of minimally invasive thoracic surgery are many however it is not widely used among surgeons due to safety concerns and limitations with the VATS instruments Methods The Weill Cornell Medical College electronic library was used to search published articles obtained from PubMed specific to VATS lobectomies and advanced stage NSCLC and lastly robotic assisted lobectomies using only the da Vinci Robotic System All articles were published in peer reviewed journals only full text articles online written in English were selected Results The studies analyzed for this review showed that in selected patients with advanced stage NSCLC VATS could be feasible and safe with adequate oncological resection However limitations with the VATS instruments can make dissection challenging due to difficulties with arm manipulation with resultant high conversion rates to thoracotomy A limited number of studies showed that these challenges could be overcome with the use of the da Vinci Robotic System Conclusions Studies are needed to further explore the potential benefits of the da Vinci Robotic System This new technology can be offered to selected patients who would traditionally undergo a thoracotomy This can result in lower conversion rates and an increase in the number of

patients undergoing and benefiting from minimally invasive thoracic surgery
