Membrane Dynamics And Domains:

Membrane Dynamics and Domains Peter J. Quinn, 2013-06-29 The fluid mosaic model of membrane structure formulated by Singer and Nicolson in the early 1970s has proven to be a durable concept in terms of the principles governing the organization of the constituent lipids and proteins During the past 30 or so years a great deal of information has accumulated on the composition of various cell membranes and how this is related to the different functions that membranes perform Nevertheless the task of explaining particular functions at the molecular level has been hampered by lack of structural detail at the atomic level The reason for this is primarily the difficulty of crystallizing membrane proteins which require strategies that differ from those used to crystallize soluble proteins The unique exception is bacteriorhodopsin of the purple membrane of *Halobacterium halobium* which is interpolated into a membrane that is neither fluid nor in a mosaic configuration To date only 50 or so membrane proteins have been characterised to atomic resolution by diffraction methods in contrast to the vast data accumulated on soluble proteins Another factor that has been difficult to explain is the reason why the lipid complement of membranes is often extremely complex Many hundreds of different molecular species of lipid can be identified in some membranes Remarkably the particular composition of each membrane appears to be maintained within relatively narrow limits and its identity distinguished from other morphologically distinct membranes

Membrane Dynamics and Calcium Signaling Joachim Krebs, 2018-03-28 This book describes the newest discoveries on calcium signaling happening at the cellular and intracellular membranes often exerted in so called microdomains Calcium entry and release its interaction with proteins and resulting events on proteins and organelles are comprehensively depicted by leading experts in the field Knowledge about details of these highly dynamic processes rapidly increased in recent years the book therefore provides a timely summary on the processes of calcium signaling and related membrane dynamics it is aimed at students and researchers in biochemistry and cell biology

Membrane Organization and Dynamics Amitabha Chattopadhyay, 2017-12-06 This volume brings together information on membrane organization and dynamics from a variety of spectroscopic microscopic and simulation approaches spanning a broad range of time scales The implication of such dynamic information on membrane function in health and disease is a topic of contemporary interest The chapters cover various aspects of membrane lipid and protein dynamics explored using a battery of experimental and theoretical approaches The synthesis of information and knowledge gained by utilizing multiple approaches will provide the reader with a comprehensive understanding of the underlying membrane dynamics and function which will help to develop robust dynamic models for the understanding of membrane function in healthy and diseased states In the last few years crystal structures of an impressive number of membrane proteins have been reported thanks to tremendous advances in membrane protein crystallization techniques Some

of these recently solved structures belong to the G protein coupled receptor GPCR family which are particularly difficult to crystallize due to their intrinsic flexibility Nonetheless these static structures do not provide the necessary information to understand the function of membrane proteins in the complex membrane milieu This volume will address the dynamic nature of membrane proteins within the membrane and will provide the reader with an up to date overview of the theory and practical approaches that can be used This volume will be invaluable to researchers working in a wide range of scientific areas from biochemistry and molecular biology to biophysics and protein science Students of these fields will also find this volume very useful This book will also be of great use to those who are interested in the dynamic nature of biological processes

Membrane Dynamics and Transport of Normal and Tumor Cells L. Trón,1984 **Molecular Organization of Membranes: Where Biology Meets Biophysics** Marek Cebecauer,David Holowka,2018-02-07 Biological membranes protect cells and organelles from the surrounding environment but serve also as organising platforms for physiological processes such as cell signalling The hydrophobic core of membranes is composed of lipids and proteins influencing each other Local membrane composition and properties define its molecular organisation and in this way regulate the function of all associated molecules Therefore studying interactions of components biophysical properties and overall membrane dynamics provides essential information on its function in the context of cell activities Such knowledge can contribute to biomedical fields such as pharmacology immunology neurobiology and many others The goal of the Research Topic entitled Molecular organisation of membranes where biology meets biophysics was to provide a comprehensive platform for publishing articles reviews and opinions focused on membrane organisation and the forces behind its heterogeneous and dynamic structure We collected 11 works which cover topics as diverse as general membrane organisation models membrane trafficking and signalling regulation biogenesis of caveolae protein lipid interactions and the importance of membrane associated tetraspanins networks The prevalent theme was the existence of membrane nanodomains To this point new emerging technologies are presented which own the power to bring a novel insight on how membrane nanodomains are formed and maintained and what is their function We believe that the collection of works in this Research Topic brings forward some important questions which will stimulate further research in this difficult but exciting field GPI-anchored Membrane Proteins and Carbohydrates Daniel Hoessli,1999 In both microbes and mammalian cells such molecules plasma membrane constituents have become intriguing and inquiries into why and how they accumulate and function in membranes have led to the elaboration of new concepts in membrane biology The 11 studies here report recent findings on such topic
