Mine Waste Management:

Mine Waste Management Hutchison, Richard D. Ellison, 1992-02-21 Mine Waste Management bridges the gap between mine operators regulators and design engineers concerned with the safe design and operation of mine waste management units It provides a comprehensive approach for determining the amount of engineered containment that needs to be provided to reduce the risk to water resources to acceptable levels The approach considers all pertinent aspects including the intrinsic properties of the waste as well as site specific conditions such as climate geology and distance to water resources Topics covered in Mine Waste Management include an evaluation of the performance of waste containment at modern mining operations the mine waste characterization disposal facility liner and closure designs ground water monitoring heap leach operations and an analysis of the cost impacts of mine waste disposal The material presented contains technical discussions and information as well as recommendations on how the technical issues can be accommodated in mine waste regulations The book is brimming with technical design charts tables and equations to provide hands on aid to designers Furthermore each chapter concludes with regulatory considerations that incorporate the proposed technical design approaches Mine Waste Management is a valuable resource for mining industry professionals regulators mine waste facility designers mine superintendents and managers consulting engineers and students in environmental engineering mining and metallurgy

and or underground The technology of consolidated tailings stockpile CTS that disposes tailings above ground is introduced and the application of this technology is also demonstrated Besides the technology of cemented tailings or paste backfill CTB or CPB which deals with tailings underground is also discussed The properties of CTB materials and the utilization of CTB technology are described and analyzed For coal mines the main mine wastes are coal gangue and fly ash The technology of cemented coal gangue fly ash backfill CGFB that manages coal mine waste underground is presented The THMC coupling properties of CGFB materials are investigated which can contribute to a better design of stable durable and environmentally friendly CGFB mixtures The application of CGFB technology in a coal mine is also presented This book which systematically reviews and discusses the development of mine waste management technologies in China is expected to provide readers comprehensive information about mine waste management

Corina Hebestreit, Jan Kudełko, Joanna Kulczycka, 2003 *Sustainable Waste Management Practices for the Mining Sector Through Recycling of Mining Waste* Suchismita Satapathy, Meghana Mishra, Manas R. Das, 2024-11-20 Mining waste management is an important issue for the mining industry since it entails the safe and responsible disposal of waste created during mining operations This waste comprises tailing waste rock and other mining wastes that if not adequately managed can pose environmental and health problems Effective waste management solutions are required to reduce the environmental impact of mining and preserve the long term viability of mining operations These initiatives include improving mining practices to reduce waste generation establishing effective waste treatment and disposal systems and participating in community outreach and education programme In recent years there has been a growing emphasis on the use of new mining waste management technologies and practices The adoption of modern filtration systems bio remediation techniques and the rehabilitation of abandoned mining sites are examples of these Overall good mining waste management is critical for guaranteeing the mining industry long term sustainability and protecting the environment and communities where mining operations take place Sustainable waste management is the implementation of practices and strategies that aim to minimize aim the negative impact of mining waste while promoting resource efficiency and long term economic viability it involves employing a thorough approach that considers the entire mining waste lifetime from generation to disposal and seeks to reduce waste generation reuse or recycle items and appropriately dispose of any remaining rubbish It attempts to extend the life of materials while reducing the waste volume that is incinerated or dumped in landfills To lessen the detrimental environmental economic social and effects in consumption a thorough approach to sustainable waste management must concentrate on the life cycle of a product Mining wastes can be categorized into overburden waste rock tailings and mine water During mineral extracted beneficiated and processed mining wastes are produced The first stage known as extraction which is the first layer sacking of minerals Typically blasting is used to do this which produces a significant amount of garbage soil debris and other material This is usually only concentrated within the periphery of a mine rental place and

occasionally on public land and is useless to the industry The amount of waste produced increases with the size of the mine Because they produce far more trash than underground mines opencast mines are consequently more pollutant intensive Use of tailing waste of iron mines with clay for producing bricks can lead to consumption of large quantities of the waste materials and managing it in an environmentally friendly way On the other hand it can reduce consumption of top soil for making bricks and improve construction materials availability Similarly for preparation of ceramics and polymer composite these wastes can be used which will help in solving social environmental problem *Mine Waste Disposal Technology*, 1981
