

illusion that the process would be easy, quick, uniformly beneficial, or total. The task of sociological analysis, now as then, is not to deliver ad hoc evaluations but to show what factors lead to what outcomes, and how. The volume in hand takes us a long step forward in the analytical part of its job, even if its evaluations seem more arbitrary and less historical and comparative than one would expect from such a sophisticated contribution.

Racial Interaction in School and Society is described by the authors as having been "conceived in frustration and despair" and written with the intention of helping in the struggle of persons "to live and to learn from one another." Nearly all of the citations antedate 1971, but the authors believe that the basic dynamics of black-white relationships have not changed since the turbulence of 1966-71. The focus is upon racial prejudice, especially as exemplified in the experiences of black students in predominantly white schools. Many of the interpretive concepts are drawn from psychoanalytic thought; use is made also of the works of Bettelheim, C. Silberman, Kovel, Kardiner and Ovesey, J. Spiegel, and Hernton, among others. The book begins with an insightful interpretation of social and psychological factors in an incident in which conflict in a school spread to a whole community. Chapter II on racial interaction is less successful, having uncritically accepted theories of dependency-rage à la Elkins, Grier and Cobbs, and Kardiner and Ovesey. When the authors return in later chapters to more specific diagnosis of the situations of black students and white educators, their insights again seem generally sound, and probably useful to receptive practitioners. Little in this brief book, however, will be new to sociologists who study intergroup relations.

A Mathematical Theory of Social Change, by ROBERT L. HAMBLIN, R. BROOKE JACOBSEN, and JERRY L. L. MILLER. New York: Wiley, 1973. 237 pp. \$12.50 cloth.

THOMAS J. FARARO
University of Pittsburgh

How should a mathematical theory of social change be constructed? The authors of this monograph have definite views on this

question. Basically, their answer (given both as a general program and in terms of actual research results) is as follows. First, one must focus on numerical variables pertaining to social change. Second, the variables should be either dimensionless quantities arising from counting or they should be unique up to a change in unit, i.e., ratio scale-type. Third, one should plot the data determined by the measured values of two variables in a variety of instances. Fourth, one should formulate a "basic equation" that fits the data very well in all these instances. Fifth, one should state the general circumstances that are exemplified in each instance. Under these general circumstances the basic equation may be expected to apply. When these five conditions are satisfied we have a "law." Sixth, the laws should be integrated, as "building blocks," in an axiomatic format. The integration is the "mathematical theory."

An example of this methodology in their work will give the reader an idea of how they generally apply this program for theory construction. Ogburn had plotted the number of air passenger miles per year on domestic routes in the United States from 1930 to 1945. The plot involves two ratio-level variables (time, in duration since 1930, and distance in miles). The relation can be represented by an exponential growth function. The authors examine other data exemplifying what they call "use diffusion," including number of automobile registrations over time, number of truck registrations over time, amount of gasoline consumption over time, number of Bachelor's, Master's and Ph.D.'s produced over time, frequency of marriage and of divorces over time, and various "leisure systems," including amount of TV sets produced over time, visits to national parks over time, newspaper circulation over time and number of bowling teams over time.

The generic category "use diffusion" exemplified in such instances is defined as the type of diffusion characterized by a "rate of use of a new invention." The form of the data is not always an apparent exponential; often it appears logistic (i.e., S-shaped, so that there is an eventual asymptote of use). But the authors retrieve the exponential equation for such data by using a partition of the time-axis, generally determined by visual inspection. Within the various "epochs" of the partition we still have an exponential curve, and from epoch to epoch we have variation in parameters. The justification for this idea of "exponential epochs" is given in terms of a
