**Clinical Aspects** Heine H. Hansen, 2012-12-06 Lung cancer is one of the biggest challenges in oncology today The challenge is due to the recognition of the possibility of prevention in at least 70 80 % of all the cases and the extreme difficulties encountered in the treatment of this neoplasm Despite the knowledge of prevention measures such as cessation of cigarette smoking the incidence continues to increase in many countries The increase is particularly notable in females in the westernized countries where the death rate in females in certain regions surpasses that of breast cancer Furthermore in many developing countries lung cancer is now being diagnosed with increasing frequency in both sexes and it is expected to be a major cause of death in those countries later in this century or the beginning of next century if the tobacco consumption will continue its rapid rise With respect to therapy the 1970 es brought considerable progress in understanding of the clinical behaviour of lung cancer thereby establishing the importance of distinguishing between the major histologic types Therapeutic advancement was particularly experienced in small cell carcinoma with the introduction of combination chemotherapy after this special disease entity among lung cancers was recognized as being a disseminated disease in almost all cases at the time of diagnosis It was expected that the improvement in therapy would have continued in the early 1980 es not only for small cell lung cancer but also for the other cell types **Principles and Practice of Lung Cancer** Harvey I. Shen, Shengxi Chen, Hexiao Tang, 2025-06-03 Lung cancer is the malignant tumor with the highest incidence and mortality rate in the world With the in depth research of molecular biology and the development of targeted drugs targeted therapy has changed the pattern of lung cancer treatment In 2004 mutations in the epidermal growth factor receptor EGFR were discovered and successfully combined with the development of small molecule tyrosine kinase inhibitors TKIs ushering in the era of targeted therapy for non small cell lung cancer NSCLC After nearly 20 years of development three generations of EGFR TKIs have been widely used in clinical practice bringing significant benefits to patients prolonging survival and improving quality of life Molecular targeted therapy has good molecular selectivity which can efficiently and selectively kill tumor cells and reduce damage to normal tissues The adverse reactions of EGFR TKIs treatment for lung cancer are different from those of traditional treatments such as surgery radiotherapy and chemotherapy Targeted therapy has completely changed the diagnosis and treatment mode of lung cancer and improved the quality of life of patients However targeted therapy will eventually lead to drug resistance and more or less adverse reactions during the treatment process The efficacy and safety of EGFR TKIs in the treatment of lung cancer remain of utmost importance Besides the three generations EGFR TKIs that have already been clinically applied we urgently need to develop novel efficient and low toxicity EGFR TKIs Therefore we expect to explore the development application and side effects of EGFR TKIs for lung cancer So as to extend the overall survival and improve the quality of life The focus of this Research Topic is to explore the EGFR TKIs treatment for lung cancer These may include but are not limited to 1 Development of EGFR TKIs of lung cancer 2 Application of EGFR TKIs to lung cancer 3 Side effects of EGFR TKIs of lung cancer Please note Manuscripts consisting solely of bioinformatics computational analysis or predictions of public databases which are not accompanied by validation independent clinical or
