Mathematical Techniques For Analyzing Concurrent And Probabilistic Systems:

Mathematical Techniques for Analyzing Concurrent and Probabilistic Systems J. J. M. M. Rutten, 2004 The book consists of two sets of lecture notes devoted to slightly different methods of analysis of concurrent and probabilistic computational systems The first set of lectures develops a calculus of streams a generalization of the set of natural numbers based on the coinduction principle coming from the theory of coalgebras It is now well understood that the interplay between algebra for describing structure and coalgebra for describing dynamics is crucial for understanding concurrent systems There is a striking analogy between streams and formula calculus reminiscent of those appearing in quantum calculus These lecture notes will appeal to anyone working in concurrency theory but also to algebraists and logicians The other set of lecture notes focuses on methods for automatically verifying probabilistic systems using techniques of model checking The unique aspect of these lectures is the coverage of both theory and practice The authors have been responsible for one of the most successful experimental systems for probabilistic model checking These lecture notes are of interest to software engineers real time programmers researchers in machine learning and numerical analysts who may well be interested to see how standard numerical techniques are used in a novel context Both sets of lectures are expository and suitable for graduate courses in theoretical computer science and for research mathematicians interested in design and analysis of concurrent and probabilistic computational systems

case studies *Mathematical Frameworks for Component Software* Zhiming Liu, Jifeng He, 2006 The range of components technology is both wide and diverse but some common understanding is emerging through the ideas of model based development These include the notions of interfaces contracts services connectors and architectures Key issues in the application of the technology are becoming clearer including the consistent integration of different views of a component component composition component coordination and transformation for platforms However we still know little about theories that support analysis and synthesis of component based systems The distinct feature of this volume is its focus on mathematical models that identify the core concepts as first class modeling elements and its providing of techniques for integrating and relating them The volume contains eleven chapters by well established researchers writing from different perspectives Each chapter gives explicit definitions of components in terms of a set of key aspects and addresses some of the problems of integration and analysis of various views component specification component composition component coordination refinement and substitution and techniques for solving problems The concepts and techniques are motivated and explained with the help of examples and case studies
