Geometric Modeling and Mesh Generation from Scanned Images Yongjie Jessica Zhang, 2018-09-03 Cutting Edge Techniques to Better Analyze and Predict Complex Physical Phenomena Geometric Modeling and Mesh Generation from Scanned Images shows how to integrate image processing geometric modeling and mesh generation with the finite element method FEM to solve problems in computational biology medicine materials science and engineering Based on the author's recent research and course at Carnegie Mellon University the text explains the fundamentals of medical imaging image processing computational geometry mesh generation visualization and finite element analysis It also explores novel and advanced applications in computational biology medicine materials science and other engineering areas One of the first to cover this emerging interdisciplinary field the book addresses biomedical material imaging image processing geometric modeling and visualization FEM and biomedical and engineering applications It introduces image mesh simulation pipelines reviews numerical methods used in various modules of the pipelines and discusses several scanning techniques including ones to probe polycrystalline materials The book next presents the fundamentals of geometric modeling and computer graphics geometric objects and transformations and curves and surfaces as well as two isocontouring methods marching cubes and dual contouring It then describes various triangular tetrahedral and quadrilateral hexahedral mesh generation techniques The book also discusses volumetric T spline modeling for isogeometric analysis IGA and introduces some new developments of FEM in recent years with applications

Similarity Measures for Face Recognition Enrico Vezzetti ,Federica Marcolin, 2015-04-27 Face recognition has several applications including security such as authentication and identification of device users and criminal suspects and in medicine corrective surgery and diagnosis Facial recognition programs rely on algorithms that can compare and compute the similarity between two sets of images This eBook explains some of the similarity measures used in facial recognition systems in a single volume Readers will learn about various measures including Minkowski distances Mahalanobis distances Hansdorff distances cosine based distances among other methods The book also summarizes errors that may occur in face recognition methods Computer scientists facing face and looking to select and test different methods of computing similarities will benefit from this book The book is also useful tool for students undertaking computer vision courses

Multi-Sensor Imaging and Fusion: Methods, Evaluations, and Applications, volume III Zhiqin Zhu, Yu Liu, Huafeng Li, Jinxing Li , Bo Xiao, 2025-11-06 Multi sensor image fusion focuses on processing images of the same object or scene acquired by multiple sensors in which various sensors with multi level and multi spatial information are complemented and combined to ultimately yield a consistent interpretation of the observed environment In recent years multi sensor image fusion has become a highly active topic and various fusion methods have been proposed Many effective processing methods including multi scale transformation fuzzy inference and deep learning have been introduced to design fusion algorithms Despite the great progress there are still some noteworthy challenges in

the field such as the lack of unified fusion theories and methods for effective generalized fusion the lack of fault tolerance and robustness the lack of benchmarks for performance evaluation the lack of work on specific applications of multi sensor image fusion and so on This Research Topic focuses on reporting advanced studies related to multi sensor image fusion including methods evaluations and applications aiming to promote the development of multi sensor image fusion techniques and applied it to medical image segmentation biology analysis and astronomy imaging More specifically this special issue expects high quality work such as unified fusion theories and effective generalized fusion methods effective performance evaluation methods for multi sensor image fusion and practical applications of multi sensor image fusion in classification detection and segmentation tasks Multi sensor fusion methods can be developed based on traditional processing methods or deep learning methods For performance evaluations benchmarks involving datasets objective metrics and baseline creation methods are welcome to be investigated In addition specific applications are also welcome to be studied such as the fusion of images from different modalities using multi sensor fusion techniques Multi sensor image registration Multi sensor image fusion High dynamic range imaging Multi sensor modality object detection and segmentation Machine learning deep learning for multi sensor image processing Multi sensor image fusion datasets and benchmarks Objective evaluation of multi sensor image fusion Multi sensor image fusion in different fields Multi sensor information monitoring and detection Multi sensor information processing Multi source natural Language and Image Fusion Processing

Handbook of Mathematical Methods in Imaging Otmar Scherzer,2010-11-23 The Handbook of Mathematical Methods in Imaging provides a comprehensive treatment of the mathematical techniques used in imaging science The material is grouped into two central themes namely Inverse Problems Algorithmic Reconstruction and Signal and Image Processing Each section within the themes covers applications modeling mathematics numerical methods using a case example and open questions Written by experts in the area the presentation is mathematically rigorous The entries are cross referenced for easy navigation through connected topics Available in both print and electronic forms the handbook is enhanced by more than 150 illustrations and an extended bibliography It will benefit students scientists and researchers in applied mathematics Engineers and computer scientists working in imaging will also find this handbook useful

Multiresolution Image Shape Description John M. Gauch,2012-12-06 Much of our understanding of the relationships among geometric structures in images is based on the shape of these structures and their relative orientations positions and sizes Thus developing quantitative methods for capturing shape information from digital images is an important area for computer vision research This book describes the theory implementation and application of two multi resolution image shape description methods The author begins by motivating the need for quantitative methods for describing both the spatial and intensity variations of structures in grey scale images Two new methods which capture this information are then developed The first the intensity axis of symmetry is a collection of branching and bending surfaces which correspond to the skeleton of the image The second method

multiresolution vertex curves focuses on surface curvature properties as the image is blurred by a sequence of Gaussian filters Implementation techniques for these image shape descriptions are described in detail Surface functionals are minimized subject to symmetry constraints to obtain the intensity axis of symmetry Robust numerical methods are developed for calculating and following vertex curves through scale space Finally the author demonstrates how grey scale images can be segmented into geometrically coherent regions using these shape description techniques Building quantitative analysis applications in terms of these visually sensible image regions promises to be an exciting area of biomedical computer vision research v Acknowledgments This book is a corrected and revised version of the author's Ph D
