Real Time Optical Information Processing:

Real-time Optical Information Processing Bahram Javidi, Joseph LeFevre Horner, 1994 Real Time Optical Information Processing covers the most recent developments in optical information processing pattern recognition neural computing and materials for devices in optical computing Intended for researchers and graduate students in signal and information processing with some elementary background in optics the book provides both theoretical and practical information on the latest in information processing in all its aspects Leading researchers in the field describe the significant signal processing algorithms architectures in optics as well as basic hardware concepts such as the fundamentals of spatial light modulators Each chapter begins with a review of basic concepts and follows with a discussion of recent advances in the field A complete bibliography on the fundamentals of each topic is also included to aid the reader Contributors are among the leading researchers in the area Chapters begin with reviews of basic concepts Complete bibliographical information is included

Optical Information Processing David Paul Casasent, Alexander A. Sawchuk, Society of Photo-optical Instrumentation Engineers, 1977 **Scientific and Technical Aerospace Reports**, 1989 *Perspectives in Optoelectronics* Sudhanshu Shekhar Jha, 1995 Optoelectronics is a rapidly expanding field of research and development In years to come it is destined to play a primary role in the growing information industry The basic philosophy behind the science and technology of optoelectronics is to create and develop photonic devices in which optical photons light waves instead of electronic carriers are manipulated for the conventional task performed by microelectronics Thanks to the availability of large bandwidth at optical frequencies the development of cost effective low loss low dispersion silica fibers for optical transmission and the possibility of ultra fast two dimensional processing the field of present day microelectronics is moving steadily towards this new technology of optoelectronics and photonics This volume presents reviews of different areas of optoelectronics written by international experts in the field covering most of the topics of recent importance It includes detailed discussions on semiconductor lasers and optical amplifiers optical fiber transmission photodetectors optoelectronic and photonic integrated circuits light wave telecommunications optical signal and image processing optical computing nonlinear and integrated optics space time Fourier optics optical metrology and sensing and optical interconnects All chapters are written in the style of a textbook containing tutorial sections which should be of great use to graduate students The volume should serve as an excellent book for graduate level course on optoelectronics modern optical engineering and optical communications

Laser Technology Lan Xinju, 2010-02-18 As different laser technologies continue to make it possible to change laser parameters and improve beam quality and performance a multidisciplinary theoretical knowledge and grasp of cutting edge technological developments also become increasingly important The revised and updated Laser Technology Second Edition reviews the principles and basic **Robot Vision** Ales Ude, 2010-03-01 The purpose of robot vision is to enable robots to perceive the external world in order to perform a large range of tasks such as navigation visual servoing for object tracking

and manipulation object recognition and categorization surveillance and higher level decision making Among different perceptual modalities vision is arguably the most important one It is therefore an essential building block of a cognitive robot This book presents a snapshot of the wide variety of work in robot vision that is currently going on in different parts of the world

Real-time Nonlinear Optical Information Processing Ahmad Armand,1979 Existing methods for nonlinear optical processing involve an intermediate photographic step which prevents real time operation Although optical information processors have a large space bandwidth product the problem of real time input has been a major limitation in taking advantage of this processing ability In this research the realization of nonlinear optical processing in real time is investigated Several techniques for performing such operations are presented One approach realizes the halftone method of nonlinear optical processing in real time by replacing the conventional photographic recording medium with a real time image transducer In the second approach halftoning is eliminated and the real time device is used directly In this case the nonlinearity is obtained by the inherent nonlinear characteristic of the real time device A third method uses the ability of certain real time devices to perform an intensity to spatial frequency conversion
