**Random Integral Equations with Applications to Life Sciences and Engineering**, 1974-08-20 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering Passage Times for Markov Chains R. Syski, 1992 This book is a survey of work on passage times in stable Markov chains with a discrete state space and a continuous time Passage times have been investigated since early days of probability theory and its applications The best known example is the first entrance time to a set which embraces waiting times busy periods absorption problems extinction phenomena etc Another example of great interest is the last exit time from a set The book presents a unifying treatment of passage times written in a systematic manner and based on modern developments The appropriate unifying framework is provided by probabilistic potential theory and the results presented in the text are interpreted from this point of view In particular the crucial role of the Dirichlet problem and the Poisson equation is stressed The work is addressed to applied probabilists and to those who are interested in applications of probabilistic methods in their own areas of interest The

level of presentation is that of a graduate text in applied stochastic processes Hence clarity of presentation takes precedence over secondary mathematical details whenever no serious harm may be expected Advanced concepts described in the text gain nowadays growing acceptance in applied fields and it is hoped that this work will serve as an useful introduction
