**Modern Methods of Polymer Characterization** Howard G. Barth, Jimmy W. Mays, 1991-09-03 Presents the methods used for characterization of polymers In addition to theory and basic principles the instrumentation and apparatus necessary for methods used to study the kinetic and thermodynamic interactions of a polymer with its environment are covered in detail Some of the methods examined include polymer separations and characterization by size exclusion and high performance chromatography inverse gas chromatography osmometry viscometry ultracentrifugation light scattering and spectroscopy

Polymer Characterization Interdisciplinary Approaches Clara D. Craver, 2012-12-06 Physical and spectroscopic methods have been used jointly for characterization of polymers for at least four decades Yet new techniques permit increasingly refined determination of polymer chemistry and morphology\_ The correlation of this knowledge with physical properties of polymers is helpful to planned synthesis of new products The most prominent spectroscopic techniques through the forties and fifties were infrared and ultraviolet spectroscopy Nuclear magnetic resonance electron spin resonance and Mossbauer spectroscopy started making significant contributions to polymer chemistry in the early sixties Still more recently

fluorescence spectroscopy and laser Raman spectroscopy have become readily applicable to polymers and are contributing significantly to the understanding of the relationship between polymer structure and properties. Determination of the distribution of monomer sequences by molecular size has become possible through combined gel permeation chromatography and spectroscopic analysis. Fragments of polymers from chemical breakdown or from pyrolysis are further fractionated and structurally analyzed. The relationship between the chemistry of polymers and performance can be determined from changes in chemical structure and orientation after curing, degradation or physical or thermal manipulation of the polymers.

The blending of polymers continues to be a major area of polymer research in academia and industry and in addition to its instructive role, each chapter serves as a review of the blend literature as relevant to a polymer blends researcher.

[Analysis of Rubber and Rubber-like Polymers](#) M.J. Loadman, 1999-04-30 The first edition of this book (1958) described an analytical situation which had existed for a number of years for maintaining quality control on vulcanizates of natural rubber, although the situation had recently been disturbed by the introduction of a range of synthetic rubbers which

required identification and quantitative estimation For the former purpose wet chemistry based on various imperfectly understood organic reactions was pressed into service Alongside this was the first introduction of instrumental analysis using the infrared spectra of either the polymers or more usually their pyrolytic products to fingerprint the material The identification of a range of organic accelerators antioxidants and their derivatives which had been introduced during the 1920s and 30s was in the first edition dealt with by a combination of column chromatography and infrared spectroscopy or by paper chromatography Quantitative procedures were however still classical in the tradition of gravimetric or volumetric assays with an initially weighed sample yielding after chemical manipulation a carefully precipitated dried and weighed end product or a solution of known composition whose weight or titre as a percentage of the initial sample quantified the function being determined The second edition of this work 1968 consolidated the newer techniques which had been introduced in the first without adding to them although in other applications of analytical chemistry instrumental analysis had already brought about a transformation in laboratory practice
