The Search for a Primordial Magnetic Field Dai G. Yamazaki, Elsevier (Amsterdam), 2012 **Cosmical Magnetic Fields** E. N. Parker, 2019-04-15 This book explores the universal spontaneous generation of magnetic fields in astronomical bodies and the agitation of the bodies by those fields Properties of magnetic fields their appearance in the universe and the havoc they wreak are described in simple physical terms to define the broad scientific problem presented by magnetic fields

Astrophysical Magnetic Fields Anvar Shukurov, Kandaswamy Subramanian, 2021-12-16 This self contained introduction to astrophysical magnetic fields provides a comprehensive review of the current state of the field and a critical discussion of the latest research Its emphasis on results that are likely to form the basis for future progress benefits a broad audience of advanced students and active researchers

Cosmic Magnetic Fields Richard Wielebinski, Rainer Beck, 2005-09-13 While magnetic fields permeate the universe on all scales the present book is dedicated to their investigation on the largest scales and affords a balanced account of both theoretical and observational aspects Written as a set of advanced lectures and tutorial reviews that lead up to the forefront of research this book offers both a modern source of reference for the experienced researchers as well as a high level introductory text for postgraduate students and nonspecialist researchers working in related areas

The Center of the Galaxy Mark Morris, 2012-12-06 The investigation of the Galactic nucleus and its surroundings is necessarily a modern endeavor for traditional observations made at visual wavelengths have not even begun to penetrate the veil of 30 magnitudes of visual extinction that intercedes On the other hand infrared and especially radio observers find a relatively unobstructed view of the central portion of the Galaxy so the study of this arena has proceeded apace with the development of these branches of astronomy Thus it is no accident that the first IAU sponsored conference to be held on the Galactic center is timed to coincide with the initiation or the immediate aftermath of major technical developments at long wavelengths including infrared array detectors millimeter wavelength aperture synthesis and self calibration and refined deconvolution algorithms in aperture synthesis radio astronomy The center of the Galaxy is also accessible to X and gamma ray observers and progress at high energies has been steady especially as imaging capabilities are being realized at X ray wavelengths However one might expect that the revolution in the high energy domain is still ahead of us as instruments with larger collecting areas and improved spatial resolution are now being developed The youth of this subject is evidenced by the relatively small number of meetings that have been devoted to it

Psychological and Social Structures Sandor B. Brent,2020-09-10 Originally published in 1984 this work is organised in three parts Each part consists of several related chapters Each chapter explores the assumptions and implications of a closely related group of concepts in depth Part 1 explores what a structure is It considers such notions as content context constraint unity integrity and the hierarchical and nucleate forms of organization Part 2 critically explores the dynamic energetic conceptualization of psychological and social phenomena Thus this part considers such notions as energy entropy activity confirmation discrepancy and resistance as they apply to and affect the stability activity and changes observed in psychological and social structures The relationship among the biological metabolic psychological and social levels of analysis are explored from a rather simplified thermodynamic point of view In Part 3 brings all these earlier considerations to bear upon the processes by which these structures grow and develop It explores the concept of development itself and such related issues as the levels by stages model of development the distinction between intrastructural and intergenerational development the orthogenic principles the process of primordial differentiation and integration development as a dialectical process and the relationship between growth and development The Epilogue indicates briefly some of the implications of the present thesis for future empirical and theoretical investigations

Cosmic Magnetic Fields (IAU S259) International Astronomical Union. Symposium,2009-06-11 Cosmic magnetic fields play a key role in the formation structure and evolution of planets stars and galaxies and possibly the Universe as a whole Magnetic fields of celestial bodies have been studied for a century since the discovery of the first extraterrestrial magnetic field by George Ellery Hale in 1908 but their origin and evolution remain open questions for fundamental physics and astrophysics IAU Symposium 259 presents the first interdisciplinary and yet comprehensive review of the role of magnetic fields on all scales that involved astronomers and physicists from across the community It gives a

balanced account of both theoretical and observational aspects of topics ranging from Earth's habitability to the origin of the universe. This volume gives a forefront research account on the current state of the art.

Primordial Magnetic Fields from Variable α Theories Nirmalya Barat, 2005 *Primordial Magnetic Fields: Evolution and Signatures* Salome Mchedlidze, 2024. Magnetic fields permeate our Universe on all cosmic scales from planets and stars to the large scale fields found in galaxies and galaxy clusters. Different observational methods such as the ones using the Faraday rotation effect as well as the diffuse radio emission detected in the form of radio halos and radio relics infer a field strength of the order of microGauss and coherence scales reaching a few tens of kpc in galaxy clusters. It is commonly assumed that the observed fields today are originated from either astrophysical or cosmological primordial magnetic seeds. The observational consequences of primordial fields. Chiara Caprini, 2011-04. The use of the observational properties of the Cosmic Microwave Background radiation CMB to constrain the presence of different components in the universe which perturb the background metric is nowadays a well established methodology in Cosmology. In this thesis the methodology is applied to three cases: primordial magnetic fields, a hypothetical electric charge asymmetry in the universe, and the inflaton field. The main part of the thesis deals with the problem of cosmic magnetic fields assuming that they were formed in the early universe; we derive upper bounds on their intensity and analyse the imprint of a helical magnetic field on the CMB. We also study the effect of a global electric charge asymmetry and deduce upper limits on the charge of some fundamental particles, partly improving the current ones from laboratory experiments. The first chapters of the thesis are dedicated to the review of the theoretical framework at the basis of the treated topics; we give an overview of the physics of cosmic magnetic fields from observations to the theory of their generation, of cosmological linear perturbation theory, and of the formalism of CMB anisotropies and polarisation. *Evolution of Primordial Magnetic Fields in the Early Universe* Stefan Banerjee, 2002. *Evolution of a Primordial Galactic Magnetic Field* Armando McNeil Howard, 1995.

The Primordial Magnetic Field Generated at Large Field Inflation, Natural Inflation, and R²-inflation by F²FF Model Anwar Saleh AlMuhammad, 2015. Large scale magnetic fields seem to be present in almost all astrophysical systems and scales from planets to superclusters of galaxies and in very low density intergalactic media. The upper limit of primordial magnetic fields PMF has been set by recent observations by the Planck observatory 2015 to be of the order of a few nG. The simple model F²FF used to generate the PMF during the inflation era. It is based on the breaking of conformal symmetry of electromagnetism during inflation. It is attractive because it is stable under perturbations and leads to a scale invariant PMF. However, it may suffer from two problems: backreaction and strong coupling. In the first case, the electromagnetic energy may exceed the energy of inflation $\rho_{EM} \rightarrow \infty$. In the second case, the effective electric charges become excessively large if we want to retrieve the standard electromagnetism at the end of inflation. In this research, we investigate the generation of PMF under three different models of inflation in order to avoid the backreaction problem. We compute magnetic and electric spectra.

generated by the f^2 FF model in the context of large field inflation LFI natural inflation NI and R² inflation for all possible values of model parameters for de Sitter and power law expansion of inflation The results of the research show that the scale invariant PMF can be generated in these models and the problem of backreaction may be avoided in some observational ranges R² inflation which is preferred by the recent results of Planck 2015 we calculate the upper of the scale invariant PMF generated by f^2 FF and in turns we find that the upper limit of present magnetic field B_0 Primordial Magnetic Field and Spectral Distortion of Cosmic Background Radiation Denis Puy,Patrick Peter,1998 **Dynamics of Primordial Phase Transitions, Primordial Magnetic Fields, and Big Bang Nucleosynthesis** Baolian Cheng,1993 In this thesis I have studied the dynamics of the inflationary universe and the possible cosmological consequences of a series of phase transitions which the universe may have undergone Specially I have studied the dynamics of primordial phase transitions primordial magnetic fields and Big Bang Nucleosynthesis In particular 1 I have derived the effects of magnetic fields on nucleon and particle reaction rates of astrophysical significance The sensitivity to the presence of arbitrary degeneracy and polarization has also been examined 2 I have calculated the effects of magnetic fields on Big Bang Nucleosynthesis and explored the impacts on the abundances of the light elements numerically An upper limit on the strength and coherence scale of primordial magnetic fields compatible with observations of light element abundances has been placed 3 I have proposed a new mechanism by which a magnetic field of magnitude 10^{16} gauss is generated on scales of $44m$ at the quark hadron phase transition The possibility of further enhancements due to dynamo action and of the astrophysical applications are discussed 4 I have explored the dynamics of a general first order phase transition A covariant jump condition across a bubble wall including surface tension and dissipation for a nongravitational moving surface has been derived Specially the cosmological quark hadron phase transition has been examined as a specific application of the general formalism and the possible mechanism of energy transport during the phase transition is studied 5 I have examined the role of bulk viscosity in the inflationary universe during the GUT phase transition and its effects on cosmological inflation density fluctuations and entropy production Finally I have investigated the role of gravitation in an inflationary universe and the possible relationship between gravity and inflation The initial condition and the identification of inflation problems are probed in the framework of scalar tensor theories of gravity An extended inflationary cosmological model has been proposed
