South American Primates Paul A. Garber, Alejandro Estrada, Julio Cesar Bicca-Marques, Eckhard W. Heymann, Karen B. Strier, 2008-11-13 This will be the first time a volume will be compiled focusing on South American monkeys as models to address and test critical issues in the study of nonhuman primates In addition the volume will serve an important compliment to the book on Mesoamerican primates recently published in the series under the DIPR book series The book will be of interest to a broad range of scientists in various disciplines ranging from primatology to animal behavior animal ecology conservation biology veterinary science animal husbandry anthropology and natural resource management Moreover although the volume will highlight South American primates chapters will not simply review particular taxa or topics Rather the focus of each chapter is to examine the nature and range of primate responses to changes in their ecological and social environments and to use data on South American monkeys to address critical theoretical questions in the study of primate behavior ecology and conservation Thus we anticipate that the volume will be widely read by a broad range of students and researchers interested in prosimians New World monkeys Old World monkeys apes humans as well as animal behavior and tropical biology

Navigating with White-Faced Capuchin Monkeys Bernardo Urbani, 2023-09-08 This monograph examines a set of questions concerning human and nonhuman primate cognition spatial memory foraging behavior and the ability of monkeys to form mental maps of the location and distribution of feeding and resting sites Two primary forms of spatial memory have been hypothesized for primates First it has been suggested that primates might represent spatial memory in the form of a coordinate based geometric map in which points in the landscape are stored as true coordinates and individuals calculate precise angles and distances between targets Alternatively it has been suggested that primates may internally represent spatial information as a route based topological map in which individuals use and reuse a set of common pathways and a select number of landmarks to reach a large number of targets This research examines questions of behavior and cognition in wild white faced capuchins *Cebus imitator* in northeastern Costa Rica First a natural field study or behavioral ecological study was carried out in which the diet foraging behavior activity budget natural decision making and movement patterns of wild capuchins were documented Secondly an experimental field study was performed by placing feeding platforms in the forest to determine how capuchins integrate the spatial location of these new feeding sites into an internal representation and the degree to which

travel routes are most consistent with a coordinate based or a route based spatial representation A major goal of this research is to develop an understanding of the challenges primates naturally face in locating resources that vary in time and space and to identify the set of features that may have played a fundamental role in shaping the evolution of decision making and spatial abilities in humans In conclusion the results suggest that capuchins use a route based spatial representation in large scale space and provide some evidence of a coordinate based spatial representation in small scale space *Primate Behavior* Leonard A. Rosenblum,1975

The Promise of Contemporary Primatology Erin P. Riley,2019-08-19 This book argues for a contemporary primatology that recognizes humans as integral components in the ecologies of primates This contemporary primatology uses a broadened theoretical lens and methodological toolkit to study primate behavior and ecology in increasingly anthropogenic contexts and seeks points of intersection and spaces for collaborative exchange across the natural sciences social sciences and humanities The book begins by exploring the American tradition of anthropology providing historical and disciplinary context for the emergence of field primatology and how it became a part of this tradition It then examines how primatology transformed into a field dominated by evolutionary approaches and highlights how the increasingly anthropogenic environments in which primates live present opportunities to understand primate adaptability at work In doing so it explores how an extended evolutionary approach can help explain behavioral variation in these contemporary environments Focus is then given to the ethnoprimate approach a contemporary approach that provides a pluralistic framework drawing from the natural and social sciences and humanities needed to study human primate coexistence in the Anthropocene Finally the book considers how such a crossing of disciplines can inform primate conservation in the future An important interdisciplinary reassessment this book will be of significant interest to primatologists biological anthropologists and scholars of anthropology more generally as well as evolutionary and conservation biologists
