## **Matrix Algorithms Eigensystems Volume:**

**Matrix Algorithms** G. W. Stewart, 2001-08-30 This is the second volume in a projected five volume survey of numerical linear algebra and matrix algorithms It treats the numerical solution of dense and large scale eigenvalue problems with an emphasis on algorithms and the theoretical background required to understand them The notes and reference sections contain pointers to other methods along with historical comments The book is divided into two parts dense eigenproblems and large eigenproblems The first part gives a full treatment of the widely used QR algorithm which is then applied to the solution of generalized eigenproblems and the computation of the singular value decomposition The second part treats Krylov sequence methods such as the Lanczos and Arnoldi algorithms and presents a new treatment of the Jacobi Davidson method These volumes are not intended to be encyclopedic but provide the reader with the theoretical and practical background to read the research literature and implement or modify new algorithms

**Matrix Algorithms** G. W. Stewart, 1998-08-01 This volume is the first in a self contained five volume series devoted to matrix algorithms It focuses on the computation of matrix decompositions that is the factorization of matrices into products of similar ones The first two chapters provide the required background from mathematics and computer science needed to work effectively in matrix computations The remaining chapters are devoted to the LU and QR decompositions their computation and applications The singular value decomposition is also treated although algorithms for its computation will appear in the second volume of the series The present volume contains 65 algorithms formally presented in pseudocode Other volumes in the series will treat eigensystems iterative methods sparse matrices and structured problems The series is aimed at the nonspecialist who needs more than black box proficiency with matrix computations To give the series focus the emphasis is on algorithms their derivation and their analysis The reader is assumed to have a knowledge of elementary analysis and linear algebra and a reasonable amount of programming experience typically that of the beginning graduate engineer or the undergraduate in an honors program Strictly speaking the individual volumes are not textbooks although they are intended to teach the guiding principle being that if something is worth explaining it is

worth explaining fully This has necessarily restricted the scope of the series but the selection of topics should give the reader a sound basis for further study

**Matrix Algorithms: Volume 1, Basic Decompositions** G. W. Stewart, 1998-08-01 This thorough concise and superbly written volume is the first in a self contained five volume series devoted to matrix algorithms It focuses on the computation of matrix decompositions the factorization of matrices into products of similar ones The first two chapters provide the required background from mathematics and computer science needed to work effectively in matrix computations The remaining chapters are devoted to the computation and applications of the LU and QR decompositions The series is aimed at the nonspecialist who needs more than black box proficiency with matrix computations A certain knowledge of elementary analysis and linear algebra is assumed as well as a reasonable amount of programming experience The guiding principle that if something is worth explaining it is worth explaining fully has necessarily restricted the scope of the series but the selection of topics should give the reader a sound basis for further study
