of these pipelines is a relatively new technology and continues to evolve in its quest to reduce costs and minimise the effect on the environment With over 25years experience Professor Yong Bai has been able to assimilate the essence of the applied mechanics aspects of offshore pipeline system design in a form of value to students and designers alike It represents an excellent source of up to date practices and knowledge to help equip those who wish to be part of the exciting future of this industry

Recommended Practice : RP Veritas Offshore Technology and Services,1988 *Offshore Pipelines* Boyun Guo,Shanhong Song Ph.D.,Ali Ghalambor,Tian Ran Lin PhD,Jacob Chacko,2005-04-25 Offshore Pipelines covers the full scope of pipeline development from pipeline designing installing and testing to operating It gathers the authors experiences gained through years of designing installing testing and operating submarine pipelines The aim is to provide engineers and management personnel a guideline to achieve cost effective management in their offshore and deepwater pipeline development and operations The book is organized into three parts Part I presents design practices used in developing submarine oil and gas pipelines and risers Contents of this part include selection of pipe size coating and insulation Part II provides guidelines for pipeline installations It focuses on controlling bending stresses and pipe stability during laying pipelines Part III deals with problems that occur during pipeline operations Topics covered include pipeline testing and commissioning flow assurance engineering and pigging operations This book is written primarily for new and experienced engineers and management personnel who work on oil and gas pipelines in offshore and deepwater It can also be used as a reference for college students of undergraduate and graduate levels in Ocean Engineering Mechanical Engineering and Petroleum Engineering Pipeline design engineers will learn how to design low cost pipelines allowing long term operability and safety Pipeline operation engineers and management personnel will learn how to operate their pipeline systems in a cost effective manner Deepwater pipelining is a new technology developed in the past ten years and growing quickly

Two-phase Flow in Pipelines and Risers Erik Asp Hansen,1986 *Subsea Pipeline Design, Analysis, and Installation* Qiang Bai,Yong Bai,2014-02-18 As deepwater wells are drilled to greater depths pipeline engineers and designers are confronted with new problems such as water depth weather conditions ocean currents equipment reliability and well accessibility Subsea Pipeline Design Analysis and Installation is based on the authors 30 years of experience in offshore The authors provide rigorous coverage of the entire spectrum of subjects in the discipline from pipe installation and routing selection and planning to design construction and installation of pipelines in some of the harshest underwater environments around the world All inclusive this must have handbook covers the latest breakthroughs in subjects such as corrosion prevention pipeline inspection and welding while offering an easy to understand guide to new design codes currently followed in the United States United Kingdom Norway and other countries Gain expert coverage of international design codes Understand how to design pipelines and risers for today s deepwater oil and gas Master critical equipment such as subsea control systems and pressure piping *Static and Dynamic Analysis of Marine Pipelines and Risers* ,1903 This thesis

investigates two slender body problems namely the static and dynamic analysis of submarine pipeline spans and the dynamic analysis of marine risers In view of structural and environmental similarities these problems are closely related and where possible common analysis procedures have been developed For the problem of pipe spanning attention is focused on the possibility of vortex induced vibration and the associated question of span assessment This situation arises when following the discovery of a span an assessment is required to determine if any remedial repair work required To assist in this assessment and also to provide a more fundamental understanding of span behaviour number of mathematical models are developed First linear beam column theory is used to determine the span natural frequencies and buckling load for a single span supported continuously on either side by an elastic foundation The effects of internal external pressures and product temperature are included and the results presented terms of two independent nondimensional parameters Next the effects of pipe soil friction and change in geometry are considered utilising a nonlinear Finite Element model Theories are developed for a nonlinear pipe element with axial bending coupling and a nonlinear nonconservative pipe soil friction element The effects of initial seabed geometry and finite amplitude vibration are included and it shown that span frequencies are sensitive to both end friction constraints and seabed geometry For marine riser dynamics an attempt is made to synthesise the best parts from the many and varied analysis methods developed to date into a simple but flexible design orientated program The riser is represented using a Finite Element model similar to that employed for the pipeline spans and a reduced set of equations obtained using a component mode synthesis method Several riser articulated column designs are considered and the results found to

Rules for Classification and Construction ,1995 *Dynamic Behavior of Pipelines for Marine Applications* Ioannis K. Chatjigeorgiou,2023-03-18 The dynamic behavior of pipelines describes the time varying continuous response of these structures under extreme effects that are generated by the surrounding environment waves and sea currents and motions imposed by the host floating facility This book describes all known impacts that affect the behavior and operation of a pipeline conveying an inner flow for underwater applications Known Impacts are those phenomena that are considered important according to practice and experience Underwater pipelines are typical unique structures that are attached to unique floating facilities The design and utilization of underwater pipelines depend strongly on the installation site and the intended application s particulars It is possible that future technology demands will require us to cope with additional challenges that will be considered important for the design and operation of underwater pipelines leading inevitably to the enhancement of the known challenges

Geotechnical Analysis of Offshore Pipelines and Steel Catenary Risers Matthew Steven Hodder,University of Western Australia. School of Civil and Resource Engineering,University of Western Australia. Faculty of Engineering, Computing and Mathematics,2009 As hydrocarbon developments move further offshore into deeper water the pipelines and risers used in the transportation of oil and gas form an increasingly significant component of the development infrastructure Offshore pipelines and risers must be designed to

withstand exposure to a range of loading conditions throughout their lifetime On bottom pipelines laid directly on the seabed must be shown to be stable and not become overstressed when subjected to environmental and operational loads Similarly risers which transport hydrocarbon products between deep water floating platforms and the seabed are subjected to various cyclic loadings and must be shown to not suffer from fatigue damage The interaction of the pipeline or riser with the seabed serves as boundary conditions in a structural analysis of the system Therefore an accurate representation of the geotechnical behaviour in a pipe soil interaction model is critical to the assessment of structural response This thesis investigates the interaction of cylindrical objects with soil and its application to the analysis and design of offshore pipelines and risers The behaviour observed during experimental investigations performed to assess the effect of various loading conditions on pipe soil interaction response is used to develop analytical models which are appropriate for use in an integrated soil structure interaction assessment of the pipe soil system The combined vertical lateral behaviour of on bottom pipelines is explored An interaction model is presented which is applicable to the prediction of pipeline response when subjected to combined vertical and lateral loading on a soft clay seabed in undrained conditions The effects of various vertical cyclic loading regimes on pipe soil interaction in soft clay are investigated experimentally Results from a suite of tests exploring a wide range of vertical cyclic loading conditions in the touchdown zone of a steel catenary riser are presented Pipe soil interaction stiffness is observed to vary widely according to operative seabed strength variation from initial in situ strength conditions Analytical frameworks are presented which describe the variability of operative undrained shear strength due to the effects of soil remoulding along with subsequent reconsolidation The overall behaviour of the lower section of a steel catenary riser is explored experimentally Details of an instrumented pipeline which was developed to investigate three dimensional riser seabed response are presented The apparatus and analysis methodology developed allows for comparison of behaviour observed during experiments performed using a short element of pipeline assuming two dimensional plane strain conditions and the validation of pipe soil interaction models developed from element tests This thesis progresses the understanding of geotechnical aspects of offshore pipeline and riser behaviour It advances the predictive capabilities of pipe soil interaction models enabling more accurate response assessment and efficient design
