Natural Ecosystems:

Evaluating the flow regulating functions of natural ecosystems in the Zambezi River Basin McCartney, M., Cai, X., Smakhtin, V., 2013 By affecting evapotranspiration and influencing how water is routed and stored in a basin forests wetlands and floodplains play a crucial role in the hydrological cycle Although they are widely attributed a major role in regulating flows i e both attenuating floods and maintaining flow during dry periods these services are rarely factored into the planning and management of water resources One reason for the failure to include them is lack of understanding Very often the extent to which natural regulating functions really occur is unclear Against this background this report describes a simple pragmatic approach for quantifying the flow regulating functions of natural ecosystems The method has been applied at 14 locations in the Zambezi River Basin

Nature's Services Gretchen Cara Daily, 2012-09-26 Life itself as well as the entire human economy depends on goods and services provided by earth's natural systems The processes of cleansing recycling and renewal along with goods such as seafood forage and timber are worth many trillions of dollars annually and nothing could live without them Yet growing human impacts on the environment are profoundly disrupting the functioning of natural systems and imperiling the delivery of these services Nature's Services brings together world renowned scientists from a variety of disciplines to examine the character and value of ecosystem services the damage that has been done to them and the consequent implications for human society Contributors including Paul R Ehrlich Donald Kennedy Pamela A Matson Robert Costanza Gary Paul Nabhan Jane Lubchenco Sandra Postel and Norman Myers present a detailed synthesis of our current understanding of a suite of ecosystem services and a preliminary assessment of their economic value Chapters consider major services including climate regulation soil fertility pollination and pest control philosophical and economic issues of valuation case studies of specific ecosystems and services implication of recent findings and steps that must be taken to address the most pressing concerns Nature's Services represents one of the first efforts by scientists to provide an overview of the many benefits and services that nature offers to people and the extent to which we are all vitally dependent on those services The book enhances our understanding of the value of the natural systems that surround us and can play an essential role in encouraging greater efforts to protect the earth's basic life support systems before it is too late

Ecosystem Management for Parks and Wilderness James K. Agee, Darryll R. Johnson, 1988 The need for cooperation among government agencies as well as an interdisciplinary approach to the increasingly challenging and complicated problem of managing park and wilderness areas prompted the University of Washington College of Forest Resources the National Park Service and the Forest Service to sponsor an ecosystem management workshop for scientists planners and managers To develop an improved conceptual approach to managing change in ecosystems crossing natural and political boundaries the workshop focused on defining terms uncovering areas of misunderstanding and barriers to cooperation and developing methods to determine the most important problems and issues

Three needs emerged from the prioritization process a precise definition of the management objectives for park and wilderness lands and how to integrate them with objectives for surrounding lands nationally as well as site specific more information about physical biological and social components of park and wilderness ecosystems from both sides of political boundaries and key indicators of ecosystem condition as well as methods for evaluating management effectiveness All of these common themes point to a need for more precise direction in management goal setting and more accurate assessment of progress toward goals The book includes an introductory chapter by the editors and summary in which they outline a direction for ecosystem management in the next critical decades The other chapters by individual contributors include studies on laws governing park and wilderness lands paleoecological records that reveal the historic effects of climatic variations on vegetation change succession and natural disturbance in relation to the problems of what can and should be preserved managing ecosystems for large populations of vertebrates the management of large carnivores effects of air pollution lake acidification human ecology and environmental management the role of economics cooperation in ecosystem management and management challenges in Yellowstone National Park

Sustaining Biodiversity and Ecosystem Functions Clement A. Tisdell, 2015-10-30

The stock of the world's biological diversity and the state of its ecosystems are major determinants of the availability of commodities both essential and desirable for human life This leading edge study provides an overarching and balanced approach to the economics of biological conservation considering man made and natural components and their interdependence Recognising the deficiencies of many contemporary studies which focus almost entirely on natural capital Clement Tisdell utilizes the concept of heritage biological capital including germplasm as part of his analysis of changes in the stock of biological capital This comprehensive synthesis casts doubt upon some propositions and policies for resource conservation recommended by eminent ecologists in areas such as GM crops and livestock husbandry as well as agroecosystems and the concept of sustainable agricultural intensification The propositions presented are lent strength by the author's decision to relate his analysis to pertinent contemporary institutional developments and scientific advances The broad scope and rational scepticism with which this book has been compiled make it an ideal read for economists interested in ecological and environmental economics natural scientists with an interest in biodiversity conservation and higher level policy makers in ecological and environmental fields

Agroecology Stephen R. Gliessman, 2007 Providing the theoretical and conceptual framework for this continually evolving field Agroecology The Ecology of Sustainable Food Systems Second Edition explores environmental factors and complexities affecting agricultural crops and animals Completely revised updated and reworked the second edition contains new data new readings new issues and case studies and new options It includes two completely new chapters one on the role of livestock animals in agroecosystems and one on the cultural and community aspects of sustainable food systems The author clearly delineates the importance of using an ecosystem framework for

determining if a particular agricultural practice input or management decision contributes or detracts from sustainability He explains how the framework provides the ecological basis for the functioning of the chosen management strategy over the long term He also examines system level interactions stressing the need for understanding the emergent qualities of populations communities and ecosystems and their roles in sustainable agriculture Using examples of farming systems in a broad array of ecological conditions the book demonstrates how to use an ecosystem approach to design and manage agroecosystems for sustainability

Ecophysiological Traits-Based Community Assembly and Maintenance of Ecosystem Functioning in Tropical Rainforests Hui Zhang,Robert John,Xiang Liu ,Suping Zhou,2026-01-30 Human activities such as agriculture and mining have caused extensive deforestation and degradation of tropical rainforests reducing them to less than 50% of their pre industrial land cover With their restoration emerging as a global challenge gaining a comprehensive understanding of community assembly and maintenance of ecosystem functioning across various types of primary secondary and degraded tropical rainforests is critical for generating a roadmap on how to successfully restore degraded tropical rainforests Functional traits have been widely proven effective for uncovering community assembly and ecosystem function maintenance in tropical rainforests However most studies gravitate toward easily measurable morphological traits such as specific leaf area and leaf dry matter content Such traits are not always a proxy for ecophysiological traits which can directly determine community assembly and ecosystem function maintenance of a tropical rainforest across diverse environments and ecosystems Therefore it is urgent to use ecophysiological traits to better understand community assembly and maintenance of ecosystems functioning across varied tropical rainforests This research topic aims to provide a platform for communication and integration of findings from different fields i e community ecology restoration ecology functional ecology and conservation biology deepen and expand the understanding of community assembly and ecosystem functioning in tropical rainforests and unravel the significant roles that ecophysiological traits play in directing community assembly and maintaining ecosystem functions across different tropical rainforests We encourage the submission of theoretical and experimental studies on different tropical rainforest ecosystems such as tropical lowland rainforests tropical cloud forests tropical island forests and so on Submissions are encouraged on but not limited to the following topics Ecophysiological trait based community assembly and maintenance of ecosystem functioning across primary and secondary tropical rainforests Ecophysiological traits based community assembly and maintenance of ecosystem functioning in degraded and restored areas of tropical rainforests Identification of ecophysiological traits that can effectively disentangle community assembly and ecosystem function maintenance in different types of tropical rainforests Trait based or phylogeny based conservation strategy for highly endangered keystone species in tropical rainforests

Sustainable Development in Practice Virgílio M. Viana,2010

Human Ecology Gerald G Marten,2010-09-23 The scope and clarity of this book make it accessible and informative to a wide readership Its messages should be an essential component of the education for all students from

secondary school to university It provides a clear and comprehensible account of concepts that can be applied in our individual and collective lives to pursue the promising and secure future to which we all aspire From the Foreword by Maurice Strong Chairman of the Earth Council and former Secretary General of the United Nations Conference on Environment and Development Earth Summit The most important questions of the future will turn on the relationship between human societies and the natural ecosystems on which we all in the end depend The interactions and interdependencies of the social and natural worlds are the focus of growing attention from a wide range of environmental social and life sciences Understanding them is critical to achieving the balance involved in sustainable development Human Ecology Basic Concepts for Sustainable Development presents an extremely clear and accessible account of this complex range of issues and of the concepts and tools required to understand and tackle them Extensively supported by graphics and detailed examples this book makes an excellent introduction for students at all levels and for general readers wanting to know why and how to respond to the dilemmas we face

Structure, Functioning and Management of Ecosystems ,1974 Nature and Resources ,1997 **Mountain Ecosystems, Stability and Instability** Bruno Messerli,Jack D. Ives,1984 *A Green and Permanent Land* Randal S. Beeman,James A. Pritchard,2001 Once patronized primarily by the counterculture and the health food establishment the organic food industry today is a multi billion dollar business driven by ever growing consumer demand for safe food and greater public awareness of ecological issues Assumed by many to be a recent phenomenon that industry owes much to agricultural innovations that go back to the Dust Bowl era This book explores the roots and branches of alternative agricultural ideas in twentieth century America showing how ecological thought has challenged and changed agricultural theory practice and policy from the 1930s to the present It introduces us to the people and institutions who forged alternatives to industrialized agriculture through a deep concern for the enduring fertility of the soil a passionate commitment to human health and a strong advocacy of economic justice for farmers Randal Beeman and James Pritchard show that agricultural issues were central to the rise of the environmental movement in the United States As family farms failed during the Depression a new kind of agriculture was championed based on the holistic approach taught by the emerging science of ecology Ecology influenced the permanent agriculture movement that advocated such radical concepts as long term land use planning comprehensive soil conservation and organic farming Then in the 1970s sustainable agriculture combined many of these ideas with new concerns about misguided technology and an over consumptive culture to preach a more sensible approach to farming In chronicling the overlooked history of

alternative agriculture A Green and Permanent Land records the significant contributions of individuals like Rex Tugwell Hugh Bennett Louis Bromfield Edward Faulkner Russell and Kate Lord Scott and Helen Nearing Robert Rodale Wes Jackson and groups like Friends of the Land and the Practical Farmers of Iowa And by demonstrating how agriculture also remains central to the public interest especially in the face of climatic crises genetically altered crops and questionable uses of pesticides this book puts these issues in historical perspective and offers readers considerable food for thought **Our**
