An Assessment of Natural Hazards and Disasters in Canada David Etkin, C.E. Haque, Gregory R. Brooks, 2003-04-30
The problems and issues of natural hazards and disasters both globally and in Canada are becoming increasingly important since the costs of extreme natural events have been escalating and significant vulnerabilities exist in Canadian society. Without thoughtful and effective mitigation these costs and human suffering are likely to continue to increase. An assessment of knowledge, research and practice in risk hazards and disasters fields is a fundamental step towards the goal of prevention and mitigation. This book on natural hazards and disasters in Canada is the first comprehensive interdisciplinary publication on this subject and is the result of a national assessment on this topic. A variety of papers from the physical and social sciences explores both the risks associated with these hazards and adaptive strategies that can be used to reduce those risks. Audience: This excellent collection of papers is intended for academics, professionals and practitioners involved in hazard reduction activities who wish to obtain a better understanding of Canadian natural hazards.

The Use of Historical Data in Natural Hazard Assessments Thomas Glade, Paola Albini, Félix Francés, 2013-03-09
Natural hazards such as earthquakes, landslides, floods, volcanic eruptions, tsunamis and hurricanes cause environmental, economic as well as sociological problems worldwide. In recent years, greater availability of information and sensational media reports of natural hazard occurrence and in particular in terms of property damage or loss of life caused by these hazards resulted in an increase of hazard awareness at a societal level. This increase in public awareness has often been misconstrued as an indication that natural hazards have been occurring more frequently with higher magnitudes in recent years, decades, thus causing more damage than in the past. It is still under debate, however, to which extent recent increases in damage can be related to changing frequencies of natural processes or whether catastrophic events occur at similar rates as they always had. If the latter is the case, the reason for a greater damage can be related to dramatic population growth over the last century with a substantial augmentation of population density in some regions. Indeed, the implications are more severe in underdeveloped and developing countries where urbanisation has increasingly occurred in hazard-prone areas such as coastal zones, alluvial river plains and steep slopes, thus causing an increase in the exposure to natural hazards. Some groups of society in wealthy countries accept higher risks in order to live directly on top of a cliff or on a steep slope to enjoy panoramic views of the landscape.

Educational Facilities and Risk Management Natural Disasters OECD, 2004-01-30
Earthquakes and other natural disasters are unpredictable and often deadly. In developed and developing countries alike, the cost in human life and infrastructure is very high. The danger to schools is of particular concern given the concentration.
