Temporally Distributed Symptoms in Technical Diagnosis Klaus Nökel,1991-07-24 Complex machines can fail in complex ways Often the nature of the fault can be determined only through the interpretation of machine behavior over time This book presents a novel approach to the representation and recognition of temporally distributed symptoms Existing diagnostic expert systems usually operate under a set of simplifying assumptions that limit their applicability A common assumption is that the device to be diagnosed has a static behavior with the relation between inputs and outputs constant over time In most realistic application domains this assumption is violated and both the normal intended function of the device and the potential malfunctions are complex behaviors over time This book addresses the problem of systematically treating information about fault symptoms that are spread out over periods of time These symptoms are characterized by a specific order of events and in the general case a single snapshot of the device state does not suffice to recognize the symptoms Instead one has to plan a measurement sequence that consists of several observations at more than one time point Starting with a classification of various types of dynamic faulty behavior the author identifies temporally distributed systems TDSs and designs a representation language that allows TDSs to be specified in a declarative manner The definition of a successful match of a measurement sequence against a TDS specification is operationalized as an algorithm which plans such an observation sequence based on the TDS specification The author demonstrates that his novel solution is a generic paradigm independent building block for diagnostic expert systems by embedding it into the frameworks of both an associative and a model based diagnostic system The book will be valuable both for researchers working on applications of temporal reasoning and prospective users of technical expert systems

Distributed Debugging: An Integrated Approach Stephen Lesavich,1991-03-15 The design and development of digital computer software for distributed concurrent programming environments has increased significantly in the past few years The presence of remote processors and concurrency greatly complicates the creation analysis testing and debugging of all software produced for these environments It appears that few tools developed for sequential environments are adequate for debugging software programs in a distributed concurrent environment The distributed concurrent environment also presents the need for special debugging tools that were not needed for sequential environments This research will present a new model for debugging programs in a distributed concurrent programming environment This new model was used to design develop and implement an integrated cooperating

set of concurrent debugging tools The new debugging model and tool set were used in a distributed Concurrent C development environment running under the UNIX operating system and connected by an Ethernet local area network Actual results obtained from using the new debugging scheme and integrated debugging tool set to detect locate and correct software faults in distributed Concurrent C programs are also presented [Web Information Systems and Mining](#) Liu
