Parallel Machines Parallel Machine Languages:

Parallel Machines: Parallel Machine Languages Robert A. Iannucci, 2012-12-06 It is universally accepted today that parallel processing is here to stay but that software for parallel machines is still difficult to develop However there is little recognition of the fact that changes in processor architecture can significantly ease the development of software In the seventies the availability of processors that could address a large name space directly eliminated the problem of name management at one level and paved the way for the routine development of large programs Similarly today processor architectures that can facilitate cheap synchronization and provide a global address space can simplify compiler development for parallel machines If the cost of synchronization remains high the programming of parallel machines will remain significantly less abstract than programming sequential machines In this monograph Bob Iannucci presents the design and analysis of an architecture that can be a better building block for parallel machines than any von Neumann processor There is another very interesting motivation behind this work It is rooted in the long and venerable history of dataflow graphs as a formalism for expressing parallel computation The field has bloomed since 1974 when Dennis and Misunas proposed a truly novel architecture using dataflow graphs as the parallel machine language The novelty and elegance of dataflow architectures has however also kept us from asking the real question What can dataflow architectures buy us that von Neumann architectures can't In the following I explain in a round about way how Bob and I arrived at this question

PARLE '89 - Parallel Architectures and Languages Europe Eddy Odijk, Martin Rem, 1989 Since the first PARLE conference PARLE 87 attracted more than 300 participants it was considered a useful and successful forum and encouraged the organization of this second issue known as PARLE 89 The initiative for these conferences was taken by project 415 of ESPRIT the European Strategic Programme for Research and Development in Information Technology of the Commission of the European Communities Their scope covers central themes in the area of parallel architectures and languages including such topics as concurrent object oriented logic and functional programming MIMD dataflow inference and reduction machines design and verification of parallel systems VLSI WSI and RISC architectures performance evaluation memory management systolic arrays applications and special purpose architectures The four invited lectures present the state of the art and advanced developments in major research areas related to the topics of the conference Of the more than 150 submitted papers 45 were selected for presentation Furthermore the program of PARLE 89 comprises presentations on the subprojects which together constitute ESPRIT project 415 Parallel architectures based on a variety of programming styles object oriented logic functional dataflow are represented in these overviews [Multicore Programming Using the ParC Language](#) Yosi Ben-Asher, 2012-05-26 Multicore Programming Using the ParC Language discusses the principles of practical parallel programming using shared memory on multicore machines It uses a simple yet powerful parallel dialect of C called ParC as the basic programming language Designed to be used in an introductory course in parallel programming and

covering basic and advanced concepts of parallel programming via ParC examples the book combines a mixture of research directions covering issues in parallel operating systems and compilation techniques relevant for shared memory and multicore machines Multicore Programming Using the ParC Language provides a firm basis for the delicate art of creating efficient parallel programs Students can exercise parallel programming using a simulation software which is portable on PC Unix multicore computers to gain experience without requiring specialist hardware Students can also help to cement their learning by completing the great many challenging and exciting exercises which accompany each chapter

Multithreaded Computer Architecture: A Summary of the State of the ART Robert A. Iannucci,Guang R.

Gao,Robert H. Halstead Jr.,Burton Smith,2012-12-06 Multithreaded computer architecture has emerged as one of the most promising and exciting avenues for the exploitation of parallelism This new field represents the confluence of several independent research directions which have united over a common set of issues and techniques Multithreading draws on recent advances in dataflow RISC compiling for fine grained parallel execution and dynamic resource management It offers the hope of dramatic performance increases through parallel execution for a broad spectrum of significant applications based on extensions to traditional approaches Multithreaded Computer Architecture is divided into four parts reflecting four major perspectives on the topic Part I provides the reader with basic background information definitions and surveys of work which have in one way or another been pivotal in defining and shaping multithreading as an architectural discipline Part II examines key elements of multithreading highlighting the fundamental nature of latency and synchronization This section presents clever techniques for hiding latency and supporting large synchronization name spaces Part III looks at three major multithreaded systems considering issues of machine organization and compilation strategy Part IV concludes the volume with an analysis of multithreaded architectures showcasing methodologies and actual measurements Multithreaded Computer Architecture A Summary of the State of the Art is an excellent reference source and may be used as a text for advanced courses on the subject
