- $X_1(5): b - c = 0 \Rightarrow E(b, b)$  is an elliptic curve defined over  $\mathbb{Q}$  with a rational torsion point of order 5.

$$E(b, b): y^2 + (1 - b)xy - by = x^3 - bx^2; \quad b \in \mathbb{Q}.$$

- When does a modular curve has infinitely many  $K$ -rational points with a number field  $K$ ?

*Many Rational Points* N.E. Hurt, 2003-11-30 This monograph presents a comprehensive treatment of recent results on algebraic geometry as they apply to coding theory and cryptography with the goal the study of algebraic curves and varieties with many rational points They book surveys recent developments on abelian varieties in particular the classification of abelian surfaces hyperelliptic curves modular towers Kloosterman curves and codes Shimura curves and modular jacobian surfaces Applications of abelian varieties to cryptography are presented including a discussion of hyperelliptic curve cryptosystems The inter relationship of codes and curves is developed building on Goppa s results on algebraic geometry cods The volume provides a source book of examples with relationships to advanced topics regarding Sato Tate conjectures Eichler Selberg trace formula Katz Sarnak conjectures and Hecke operators Automated Deduction in Geometry

Dongming Wang, 1998-03-18 This book constitutes the thoroughly refereed and revised post workshop proceedings of the International Workshop on Automated Deduction in Geometry held in Toulouse France in September 1996 The revised extended papers accepted for inclusion in the volume were selected on the basis of double reviewing Among the topics covered are automated geometric reasoning and the deduction applied to Dixon resultants Gr bner bases characteristic sets computational geometry algebraic geometry and planet motion furthermore the system REDLOG is demonstrated and the verification of geometric statements as well as the automated production of proof in Euclidean Geometry are present

Rational Points on Curves Over Finite Fields Harald Niederreiter, Chaoping Xing, 2001-06-14 Ever since the seminal work of Goppa on algebraic geometry codes rational points on algebraic curves over finite fields have been an important research topic for algebraic geometers and coding theorists The focus in this application of algebraic geometry to coding theory is on algebraic curves over finite fields with many rational points relative to the genus Recently the authors discovered another important application of such curves namely to the construction of low discrepancy sequences These sequences are needed for numerical methods in areas as diverse as computational physics and mathematical finance This has given additional impetus to the theory of and the search for algebraic curves over finite fields with many rational points This book aims to sum up the theoretical work on algebraic curves over finite fields with many rational points and to discuss the applications of such curves to algebraic coding theory and the construction of low discrepancy sequences *Elementary Theory of*

*Numbers* W. Sierpinski, 1988-02-01 Since the publication of the first edition of this work considerable progress has been made in many of the questions examined This edition has been updated and enlarged and the bibliography has been revised The variety of topics covered here includes divisibility diophantine equations prime numbers especially Mersenne and Fermat primes the basic arithmetic functions congruences the quadratic reciprocity law expansion of real numbers into decimal fractions decomposition of integers into sums of powers some other problems of the additive theory of numbers and the theory of Gaussian integers **The Moduli Space of Curves** R. Dijkgraaf, Carel Faber, Gerard B.M. van der

Geer, 1995-10-18 The moduli space  $M_g$  of curves of fixed genus  $g$  that is the algebraic variety that parametrizes all curves of genus  $g$  is one of the most intriguing objects of study in algebraic geometry these days Its appeal results not only from its beautiful mathematical structure but also from recent developments in theoretical physics in particular in conformal field theory Leading experts in the field explore in this volume both the structure of the moduli space of curves and its relationship with physics through quantum cohomology Altogether this is a lively volume that testifies to the ferment in the field and gives an excellent view of the state of the art for both mathematicians and theoretical physicists It is a persuasive example of the famous Wigners comment and its converse on the unreasonable effectiveness of mathematics in the natural science Witteens conjecture in 1990 describing the intersection behavior of tautological classes in the cohomology of  $M_g$  arose directly from string theory Shortly thereafter a stunning proof was provided by Kontsevich who in this volume describes his solution to the problem of counting rational curves on certain algebraic varieties and includes numerous suggestions for further development The same problem is given an elegant treatment in a paper by Manin There follows a number of contributions to the geometry cohomology and arithmetic of the moduli spaces of curves In addition several contributors address quantum cohomology and conformal field theory

Rational Points on Varieties Bjorn Poonen, 2017-12-13 This book is motivated by the problem of determining the set of rational points on a variety but its true goal is to equip readers with a broad range of tools essential for current research in algebraic geometry and number theory The book is unconventional in that it provides concise accounts of many topics instead of a comprehensive account of just one this is intentionally designed to bring readers up to speed rapidly Among the topics included are Brauer groups faithfully flat descent algebraic groups torsors tale and fppf cohomology the Weil conjectures and the Brauer Manin and descent obstructions A final chapter applies all these to study the arithmetic of surfaces The down to earth explanations and the over 100 exercises make the book suitable for use as a graduate level textbook but even experts will appreciate having a single source covering many aspects of geometry over an unrestricted ground field and containing some material that cannot be found elsewhere

**Numbers and Geometry** John Stillwell, 1997-10-30 A beautiful and relatively elementary account of a part of mathematics where three main fields algebra analysis and geometry meet The book provides a broad view of these subjects at the level of calculus without being a calculus book Its roots are in arithmetic and geometry the two opposite poles of mathematics and the source of historic conceptual conflict The resolution of this conflict and its role in the development of mathematics is one of the main stories in the book Stillwell has chosen an array of exciting and worthwhile topics and elegantly combines mathematical history with mathematics He covers the main ideas of Euclid but with 2000 years of extra insights attached Presupposing only high school algebra it can be read by any well prepared student entering university Moreover this book will be popular with graduate students and researchers in mathematics due to its attractive and unusual treatment of fundamental topics A set of well written exercises at the end of each section allows new ideas to be instantly tested and reinforced
