Systems Integration Through Reengineering

In today's environment, it is not unusual to find multiple business systems within an organization, which require a variety of informational needs. What process can we use to constructively address the functional needs of multiple business units because of the existence of multiple business systems? One answer is systems integration coupled with software application reengineering.

System integrator refers to combining some or all of the functionality of two or more software and/or database systems. This differs from systems interfacing which refers to linking the functionality of two or three systems via another system component specifically designed for that purpose. Systems integration implies making two or more systems work as one system and not necessarily to make one type system work as another.

The goal of reengineering is to: identify existing, reengineering management and activities that support software-based information systems directly or indirectly as organizations. This, including improvements in design, development, maintainability and security to name a few, specifically within the scope of the study, reengineering encompasses the following elements: 1) identification of the areas within a business to be improved; 2) development of a project plan and detailed timeline for the implementation of the improvements; 3) analysis, design and coding; and 4) software installation and final testing and tuning. However, the difficulty in performing a systems integration task can be compounded by additional factors.

This paper will describe the advantages of using CASE tool development software for systems integration activities. It will also address other beneficial software project management data which is created as a result.

Historically, business needed the development of their systems based on the nature of the different groups in the business. Each group had their own budget and unique functional requirements. In today's many functions within the groups were similar, but due to their uncoordinated economy, each group's system implementation differed. These groups also were not always bound to implement their systems on common computer hardware solutions. As a result, the business could often find out from staff managed with a web of multiple software applications running on multiple hardware platforms with multiple operating environments. Given today's sensitivity to cost management and global competitive pressures, it is therefore easy to see why system reengineering needs to be considered. In addition, today's business information requirements often dictate that the functionality of multiple business systems be integrated, principally because resources must and need to become shared, rather than multiple datasets. Currently, About Software Engineering (CASE) tools can be used to address the restructuring of existing systems to fit the conceptual architecture of an integrated business system and eliminate system redundancies. This paper will use as a reference a prototype project, which was created in order to evaluate the feasibility, resource requirements and benefits of using Texas Instruments (TI) Information Engineering facility (IIE) CASE tool products to reengineer existing systems. While the goal of this prototype study was not to demonstrate and measure the benefits of systems integration, it did produce summary information, which provides some insight into the utility of CASE tool software for systems development efforts.

SYSTEMS INTEGRATION THROUGH REENGINEERING

The concept of system integration planning and resource allocation is principally based upon the scope and complexity of the systems to be integrated. However, the difficulty of performing a systems integration task is also compounded by the following factors: 1) the variety of systems languages upon which the systems to be integrated are dependent.
