

Deterministic random process

A random process is called a deterministic random process, if all the future values can be predicted from past observations.

Example : Consider a random process $X(t) = A \cos(\omega t + \theta)$. This consists of a family of pure sine waves and it is completely specified in terms of the random variables A and θ . Hence, it is a deterministic random process.

Non-deterministic random process

A random process is called a non-deterministic random process, if future values of any sample function cannot be predicted from past observations.

Example : In the case of dissolving of sugar crystals in coffee, it consists of a family of functions that cannot be described in terms of finite number of parameters. The future sample function cannot be determined from the past sample functions and so it is a non-deterministic random process.
